- [9647] As mentioned hereinabove with reference to Fig. 1, a function of VGAM327 gene, herein designated VGAM is inhibition of expression of VGAM327 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM327 correlate with, and may be deduced from, the identity of the target genes which VGAM327 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9648] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM327 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:662.

[9649] A function of VGAM327 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM327 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAAM2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:662.

[9650] Another function of VGAM327 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM327 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING

SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:662.

[9651] Another function of VGAM327 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15.KIAA0475 (Accession NM_014864) is another VGAM327 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:662.

[9652] Another function of VGAM327 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM327 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:662.

[9653] Another function of VGAM327 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM327 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:662.

[9654] Another function of VGAM327 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM327 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:662.

[9655] Another function of VGAM327 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 328 (VGAM328) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9656] VGAM328 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM328 was detected is described hereinabove with reference to Figs. 1–8.

[9657] VGAM328 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9658] VGAM328 gene encodes a VGAM328 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM328 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM328 precursor RNA is designated SEQ ID:314, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:314 is located at position 188927 relative to the genome of Vaccinia Virus.

[9659] VGAM328 precursor RNA folds onto itself, forming VGAM328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9660] An enzyme complex designated DICER COMPLEX, `dices` the VGAM328 folded precursor RNA into VGAM328 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM328 RNA is designated SEQ ID:663, and is provided hereinbelow with reference to the sequence listing part.

[9661] VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM328 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9662] VGAM328 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM328 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM328 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9663] The complementary binding of VGAM328 RNA, herein designated VGAM RNA, to host target binding sites on VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM328 host target RNA into VGAM328 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9664] It is appreciated that VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM328 host target genes. The mRNA of each one of this plurality of VGAM328 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM328 RNA, herein designated VGAM RNA, and which when bound by VGAM328 RNA causes in-

hibition of translation of respective one or more VGAM328 host target proteins.

[9665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM328 gene, herein designated VGAM GENE, on one or more VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9666] It is yet further appreciated that a function of VGAM328 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM328 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM328 correlate with, and may be deduced from, the identity of the host target genes which VGAM328 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [9667] Nucleotide sequences of the VGAM328 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM328 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM328 are further described hereinbelow with reference to Table 1.
- [9668] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM328 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM328 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9669] As mentioned hereinabove with reference to Fig. 1, a function of VGAM328 gene, herein designated VGAM is inhibition of expression of VGAM328 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM328 correlate with, and may be deduced from, the identity of the target genes which VGAM328 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9670] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM328 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:663.

[9671] A function of VGAM328 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM328 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:663.

[9672] Another function of VGAM328 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM328 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:663.

[9673] Another function of VGAM328 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM328 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ

ID:663.

[9674] Another function of VGAM328 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM328 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:663.

[9675] Another function of VGAM328 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM328 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:663.

[9676] Another function of VGAM328 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM328 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:663.

[9677] Another function of VGAM328 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 329 (VGAM329) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9678] VGAM329 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM329 was detected is described hereinabove with reference to Figs. 1–8.

[9679] VGAM329 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9680] VGAM329 gene encodes a VGAM329 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM329 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM329 precursor RNA is designated SEQ

ID:315, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:315 is located at position 188927 relative to the genome of Vaccinia Virus.

[9681] VGAM329 precursor RNA folds onto itself, forming VGAM329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9682] An enzyme complex designated DICER COMPLEX, `dices` the VGAM329 folded precursor RNA into VGAM329 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM329 RNA is designated SEQ ID:664, and is provided hereinbelow with reference to the sequence list-

ing part.

[9683] VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM329 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9684] VGAM329 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM329 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM329 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9685] The complementary binding of VGAM329 RNA, herein designated VGAM RNA, to host target binding sites on VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM329 host target RNA into VGAM329 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9686] It is appreciated that VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM329 host target genes. The mRNA of each one of this plurality of VGAM329 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM329 RNA, herein designated VGAM

RNA, and which when bound by VGAM329 RNA causes inhibition of translation of respective one or more VGAM329 host target proteins.

[9687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM329 gene, herein designated VGAM GENE, on one or more VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9688] It is yet further appreciated that a function of VGAM329 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM329 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM329 correlate with, and may be deduced from, the identity of the host target genes which VGAM329 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9689] Nucleotide sequences of the VGAM329 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM329 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM329 are further described hereinbelow with reference to Table 1.

[9690] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM329 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM329 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9691] As mentioned hereinabove with reference to Fig. 1, a function of VGAM329 gene, herein designated VGAM is

inhibition of expression of VGAM329 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM329 correlate with, and may be deduced from, the identity of the target genes which VGAM329 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9692] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM329 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:664.

[9693] A function of VGAM329 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM329 host target gene. DAAM2 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:664.

[9694] Another function of VGAM329 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM329 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:664.

[9695] Another function of VGAM329 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM329 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM329

RNA, herein designated VGAM RNA, also designated SEQ ID:664.

[9696] Another function of VGAM329 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM329 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:664.

[9697] Another function of VGAM329 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM329 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:664.

[9698] Another function of VGAM329 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM329 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:664.

[9699] Another function of VGAM329 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities

of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 330 (VGAM330) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9700] VGAM330 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM330 was detected is described hereinabove with reference to Figs. 1–8.

[9701] VGAM330 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9702] VGAM330 gene encodes a VGAM330 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM330 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM330 precursor RNA is designated SEQ ID:316, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:316 is located at position 188927 relative to the genome of Vaccinia Virus.

[9703] VGAM330 precursor RNA folds onto itself, forming VGAM330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9704] An enzyme complex designated DICER COMPLEX, `dices` the VGAM330 folded precursor RNA into VGAM330 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM330 RNA is designated SEQ ID:665, and is

provided hereinbelow with reference to the sequence listing part.

[9705] VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM330 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9706] VGAM330 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM330 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM330 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9707] The complementary binding of VGAM330 RNA, herein designated VGAM RNA, to host target binding sites on VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM330 host target RNA into VGAM330 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9708] It is appreciated that VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM330 host target genes. The mRNA of each one of this plurality of VGAM330 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM330 RNA, herein designated VGAM RNA, and which when bound by VGAM330 RNA causes inhibition of translation of respective one or more VGAM330 host target proteins.

[9709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM330 gene, herein designated VGAM GENE, on one or more VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9710] It is yet further appreciated that a function of VGAM330 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM330 correlate with, and may be deduced from, the identity of the host target genes which VGAM330 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9711] Nucleotide sequences of the VGAM330 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM330 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM330 are further described hereinbelow with reference to Table 1.

[9712] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM330 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM330 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9713] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM330 gene, herein designated VGAM is inhibition of expression of VGAM330 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM330 correlate with, and may be deduced from, the identity of the target genes which VGAM330 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9714] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM330 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:665.

[9715] A function of VGAM330 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is

another VGAM330 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:665.

[9716] Another function of VGAM330 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM330 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:665.

[9717] Another function of VGAM330 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM330 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated

SEQ ID:1570, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:665.

[9718] Another function of VGAM330 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM330 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:665.

[9719] Another function of VGAM330 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM330 host target gene. LOC254901 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:665.

[9720] Another function of VGAM330 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM330 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:665.

[9721] Another function of VGAM330 is therefore inhibition of

LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 331 (VGAM331) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9722] VGAM331 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM331 was detected is described hereinabove with reference to Figs. 1–8.

[9723] VGAM331 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9724] VGAM331 gene encodes a VGAM331 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM331 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM331 precursor RNA is designated SEQ ID:317, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:317 is located at position 189067 relative to the genome of Vaccinia Virus.

[9725] VGAM331 precursor RNA folds onto itself, forming VGAM331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9726] An enzyme complex designated DICER COMPLEX, `dices` the VGAM331 folded precursor RNA into VGAM331 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide se-

quence of VGAM331 RNA is designated SEQ ID:666, and is provided hereinbelow with reference to the sequence listing part.

[9727] VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM331 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[9728] VGAM331 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM331 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM331 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9729] The complementary binding of VGAM331 RNA, herein designated VGAM RNA, to host target binding sites on VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM331 host target RNA into VGAM331 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9730] It is appreciated that VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM331 host target genes. The mRNA of each one of this plurality of VGAM331 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM331 RNA, herein designated VGAM RNA, and which when bound by VGAM331 RNA causes inhibition of translation of respective one or more VGAM331 host target proteins.

[9731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM331 gene, herein designated VGAM GENE, on one or more VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9732] It is yet further appreciated that a function of VGAM331 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM331 correlate with, and may be deduced from, the identity of the host target genes which VGAM331 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9733] Nucleotide sequences of the VGAM331 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM331 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM331 are further described hereinbelow with reference to Table 1.

[9734] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM331 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM331 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9735] As mentioned hereinabove with reference to Fig. 1, a function of VGAM331 gene, herein designated VGAM is inhibition of expression of VGAM331 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM331 correlate with, and may be deduced from, the identity of the target genes which VGAM331 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9736] Integrin, Beta 7 (ITGB7, Accession NM_000889) is a VGAM331 host target gene. ITGB7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ITGB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB7 BINDING SITE, designated SEQ ID:783, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:666.

[9737] A function of VGAM331 is therefore inhibition of Integrin, Beta 7 (ITGB7, Accession NM_000889), a gene which may play a role in adhesive interactions of leukocytes. Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with ITGB7. The function of ITGB7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM26.RPP30 (Accession NM_006413) is another VGAM331 host target gene. RPP30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPP30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPP30 BINDING SITE, designated SEQ ID:1297, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:666.

[9738] Another function of VGAM331 is therefore inhibition of RPP30 (Accession NM_006413), a gene which is a component of ribonuclease p that processes 5' ends of precursor tRNAs. Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPP30. The function of RPP30 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM26.FLJ13263 (Accession NM_025125) is another VGAM331 host target

gene. FLJ13263 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13263 BINDING SITE, designated SEQ ID:2139, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:666.

[9739] Another function of VGAM331 is therefore inhibition of FLJ13263 (Accession NM_025125). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13263. FLJ23074 (Accession NM_025052) is another VGAM331 host target gene. FLJ23074 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23074 BINDING SITE, designated SEQ ID:2133, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:666.

[9740] Another function of VGAM331 is therefore inhibition of FLJ23074 (Accession NM_025052). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23074. General Transcription Factor IIA, 2, 12kDa (GTF2A2, Accession NM_004492) is another VGAM331 host target gene. GTF2A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTF2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2A2 BINDING SITE, designated SEQ ID:1119, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:666.

[9741] Another function of VGAM331 is therefore inhibition of General Transcription Factor IIA, 2, 12kDa (GTF2A2, Accession NM_004492). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2A2. IMP-2 (Accession NM_006548) is another VGAM331 host target gene. IMP-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

IMP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMP-2 BINDING SITE, designated SEQ ID:1308, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:666.

[9742] Another function of VGAM331 is therefore inhibition of IMP-2 (Accession NM_006548). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMP-2. KIAA0212 (Accession NM_014674) is another VGAM331 host target gene. KIAA0212 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0212 BINDING SITE, designated SEQ ID:1518, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:666.

[9743] Another function of VGAM331 is therefore inhibition of KIAA0212 (Accession NM_014674). Accordingly, utilities

of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0212. Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_014835) is another VGAM331 host target gene. OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OSBPL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2, designated SEQ ID:1566 and SEQ ID:2482 respectively, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:666.

[9744] Another function of VGAM331 is therefore inhibition of Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_014835). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2. LOC254826 (Accession XM_173188) is another VGAM331 host target gene. LOC254826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254826, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254826 BINDING SITE, designated SEQ ID:3732, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:666.

[9745] Another function of VGAM331 is therefore inhibition of LOC254826 (Accession XM_173188). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254826. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 332 (VGAM332) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9746] VGAM332 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM332 was detected is described hereinabove with reference to Figs. 1–8.

[9747] VGAM332 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9748] VGAM332 gene encodes a VGAM332 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM332 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM332 precursor RNA is designated SEQ ID:318, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:318 is located at position 11 relative to the genome of Vaccinia Virus.

[9749] VGAM332 precursor RNA folds onto itself, forming VGAM332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9750] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM332 folded precursor RNA into VGAM332 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM332 RNA is designated SEQ ID:667, and is provided hereinbelow with reference to the sequence listing part.

[9751] VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM332 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9752] VGAM332 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM332 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM332 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9753] The complementary binding of VGAM332 RNA, herein designated VGAM RNA, to host target binding sites on VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM332 host target RNA into VGAM332 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9754] It is appreciated that VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM332 host target genes. The mRNA of each one of this plurality of VGAM332 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM332 RNA, herein designated VGAM RNA, and which when bound by VGAM332 RNA causes inhibition of translation of respective one or more VGAM332 host target proteins.

[9755] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM332 gene, herein designated VGAM GENE, on one or more VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9756] It is yet further appreciated that a function of VGAM332 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM332 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM332 correlate with, and may be deduced from, the identity of the host target genes which VGAM332 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9757] Nucleotide sequences of the VGAM332 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM332 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM332 are further described hereinbelow with reference to Table 1.

[9758] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM332 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM332 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9759] As mentioned hereinabove with reference to Fig. 1, a function of VGAM332 gene, herein designated VGAM is inhibition of expression of VGAM332 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM332 correlate with, and may be deduced from, the identity of the target genes which VGAM332 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9760] Desmocollin 3 (DSC3, Accession NM_001941) is a VGAM332 host target gene. DSC3 BINDING SITE1 and DSC3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DSC3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSC3 BINDING SITE1 and DSC3 BINDING SITE2,

designated SEQ ID:871 and SEQ ID:2060 respectively, to the nucleotide sequence of VGAM332 RNA, herein designated VGAM RNA, also designated SEQ ID:667.

[9761] A function of VGAM332 is therefore inhibition of Desmocollin 3 (DSC3, Accession NM_001941), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC3. The function of DSC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM306. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 333 (VGAM333) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9762] VGAM333 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM333 was detected is described hereinabove with reference to Figs. 1-8.

[9763] VGAM333 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9764] VGAM333 gene encodes a VGAM333 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM333 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM333 precursor RNA is designated SEQ ID:319, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:319 is located at position 190758 relative to the genome of Vaccinia Virus.

[9765] VGAM333 precursor RNA folds onto itself, forming VGAM333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9766] An enzyme complex designated DICER COMPLEX, `dices` the VGAM333 folded precursor RNA into VGAM333 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM333 RNA is designated SEQ ID:668, and is provided hereinbelow with reference to the sequence listing part.

[9767] VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM333 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9768] VGAM333 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM333 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM333 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9769] The complementary binding of VGAM333 RNA, herein designated VGAM RNA, to host target binding sites on VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM333 host tar-

get RNA into VGAM333 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9770] It is appreciated that VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM333 host target genes. The mRNA of each one of this plurality of VGAM333 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM333 RNA, herein designated VGAM RNA, and which when bound by VGAM333 RNA causes inhibition of translation of respective one or more VGAM333 host target proteins.

[9771] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM333 gene, herein designated VGAM GENE, on one or more VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9772] It is yet further appreciated that a function of VGAM333 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM333 correlate with, and may be deduced from, the identity of the host target genes which VGAM333 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9773] Nucleotide sequences of the VGAM333 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM333 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM333 are further

described hereinbelow with reference to Table 1.

[9774] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM333 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM333 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9775] As mentioned hereinabove with reference to Fig. 1, a function of VGAM333 gene, herein designated VGAM is inhibition of expression of VGAM333 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM333 correlate with, and may be deduced from, the identity of the target genes which VGAM333 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9776] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM333 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:668.

[9777] A function of VGAM333 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM333 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:668.

[9778] Another function of VGAM333 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM333 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM333 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:668.

[9779] Another function of VGAM333 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM15.KIAA0475 (Accession NM_014864) is another VGAM333 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:668.

[9780] Another function of VGAM333 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM333 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:668.

[9781] Another function of VGAM333 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM333 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:668.

[9782] Another function of VGAM333 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM333 host target gene. LOC257615 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:668.

[9783] Another function of VGAM333 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 334 (VGAM334) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9784] VGAM334 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM334 was detected is described hereinabove with reference to Figs. 1-8.

[9785] VGAM334 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9786] VGAM334 gene encodes a VGAM334 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM334 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM334 precursor RNA is designated SEQ ID:320, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:320 is located at position 190758 relative to the genome of Vaccinia Virus.

[9787] VGAM334 precursor RNA folds onto itself, forming VGAM334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[9788] An enzyme complex designated DICER COMPLEX, `dices` the VGAM334 folded precursor RNA into VGAM334 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM334 RNA is designated SEQ ID:669, and is provided hereinbelow with reference to the sequence listing part.

[9789] VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM334 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9790] VGAM334 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM334 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM334 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM334 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9791] The complementary binding of VGAM334 RNA, herein designated VGAM RNA, to host target binding sites on VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM334 host target RNA into VGAM334 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9792] It is appreciated that VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM334 host target genes. The mRNA of each one of this plurality of VGAM334 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM334 RNA, herein designated VGAM RNA, and which when bound by VGAM334 RNA causes inhibition of translation of respective one or more VGAM334 host target proteins.

[9793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM334 gene, herein designated VGAM GENE, on one or more VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9794] It is yet further appreciated that a function of VGAM334 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM334 correlate with, and may be deduced from, the identity of the host target genes which VGAM334 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9795] Nucleotide sequences of the VGAM334 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM334 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM334 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM334 are further described hereinbelow with reference to Table 1.

[9796] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM334 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM334 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9797] As mentioned hereinabove with reference to Fig. 1, a function of VGAM334 gene, herein designated VGAM is inhibition of expression of VGAM334 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM334 correlate with, and may be deduced from, the identity of the target genes which VGAM334 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9798] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM334 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:669.

[9799] A function of VGAM334 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM334 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:669.

[9800] Another function of VGAM334 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accord-

ingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM334 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:669.

[9801] Another function of VGAM334 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15.KIAA0475 (Accession NM_014864) is another VGAM334 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:669.

[9802] Another function of VGAM334 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM334 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:669.

[9803] Another function of VGAM334 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM334 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:669.

[9804] Another function of VGAM334 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is an-

other VGAM334 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:669.

[9805] Another function of VGAM334 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 335 (VGAM335) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9806] VGAM335 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM335 was detected is described

hereinabove with reference to Figs. 1–8.

[9807] VGAM335 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9808] VGAM335 gene encodes a VGAM335 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM335 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM335 precursor RNA is designated SEQ ID:321, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:321 is located at position 190758 relative to the genome of Vaccinia Virus.

[9809] VGAM335 precursor RNA folds onto itself, forming VGAM335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9810] An enzyme complex designated DICER COMPLEX, `dices` the VGAM335 folded precursor RNA into VGAM335 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM335 RNA is designated SEQ ID:670, and is provided hereinbelow with reference to the sequence listing part.

[9811] VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM335 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9812] VGAM335 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM335 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM335 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9813] The complementary binding of VGAM335 RNA, herein designated VGAM RNA, to host target binding sites on VGAM335 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM335 host target RNA into VGAM335 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9814] It is appreciated that VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM335 host target genes. The mRNA of each one of this plurality of VGAM335 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM335 RNA, herein designated VGAM RNA, and which when bound by VGAM335 RNA causes inhibition of translation of respective one or more VGAM335 host target proteins.

[9815] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM335 gene, herein designated VGAM GENE, on one or more VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9816] It is yet further appreciated that a function of VGAM335 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM335 correlate with, and may be deduced from, the identity of the host target genes which VGAM335 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9817] Nucleotide sequences of the VGAM335 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM335 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM335 are further described hereinbelow with reference to Table 1.

[9818] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM335 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM335 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9819] As mentioned hereinabove with reference to Fig. 1, a function of VGAM335 gene, herein designated VGAM is inhibition of expression of VGAM335 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM335 correlate with, and may be deduced from, the identity of the target genes which VGAM335 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9820] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM335 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:670.

[9821] A function of VGAM335 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM335 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:670.

[9822] Another function of VGAM335 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls

cell polarity and movement during development. Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM335 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:670.

[9823] Another function of VGAM335 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM335 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:670.

[9824] Another function of VGAM335 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM335 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:670.

[9825] Another function of VGAM335 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM335 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:670.

[9826] Another function of VGAM335 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254901. LOC257615 (Accession XM_175293) is another VGAM335 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:670.

[9827] Another function of VGAM335 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 336 (VGAM336) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9828] VGAM336 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM336 was detected is described hereinabove with reference to Figs. 1–8.

[9829] VGAM336 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9830] VGAM336 gene encodes a VGAM336 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM336 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM336 precursor RNA is designated SEQ ID:322, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:322 is located at position 188937 relative to the genome of Vaccinia Virus.

[9831] VGAM336 precursor RNA folds onto itself, forming VGAM336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9832] An enzyme complex designated DICER COMPLEX, `dices` the VGAM336 folded precursor RNA into VGAM336 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM336 RNA is designated SEQ ID:671, and is provided hereinbelow with reference to the sequence listing part.

[9833] VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM336 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9834] VGAM336 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM336 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM336 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9835] The complementary binding of VGAM336 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM336 host target RNA into VGAM336 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9836] It is appreciated that VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM336 host target genes. The mRNA of each one of this plurality of VGAM336 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM336 RNA, herein designated VGAM RNA, and which when bound by VGAM336 RNA causes inhibition of translation of respective one or more VGAM336 host target proteins.

[9837] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM336 gene, herein designated VGAM GENE, on one or more VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9838] It is yet further appreciated that a function of VGAM336 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM336 correlate with, and may be deduced from, the identity of the host target genes which VGAM336 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9839] Nucleotide sequences of the VGAM336 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM336 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM336 are further described hereinbelow with reference to Table 1.

[9840] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM336 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM336 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9841] As mentioned hereinabove with reference to Fig. 1, a function of VGAM336 gene, herein designated VGAM is inhibition of expression of VGAM336 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM336 correlate with, and may be deduced from, the identity of the target genes which VGAM336 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9842] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM336 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:671.

[9843] A function of VGAM336 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM336 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:671.

[9844] Another function of VGAM336 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2

(DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM336 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:671.

[9845] Another function of VGAM336 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM336 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15.KIAA0475 (Accession NM_014864) is another VGAM336 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:671.

[9846] Another function of VGAM336 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM336 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:671.

[9847] Another function of VGAM336 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM336 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:671.

[9848] Another function of VGAM336 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM336 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:671.

[9849] Another function of VGAM336 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 337 (VGAM337) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9850] VGAM337 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM337 was detected is described hereinabove with reference to Figs. 1–8.

[9851] VGAM337 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9852] VGAM337 gene encodes a VGAM337 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM337 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM337 precursor RNA is designated SEQ ID:323, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:323 is located at position 187719 relative to the genome of Vaccinia Virus.

[9853] VGAM337 precursor RNA folds onto itself, forming VGAM337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9854] An enzyme complex designated DICER COMPLEX, `dices` the VGAM337 folded precursor RNA into VGAM337 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM337 RNA is designated SEQ ID:672, and is provided hereinbelow with reference to the sequence listing part.

[9855] VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM337 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9856] VGAM337 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM337 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM337 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9857] The complementary binding of VGAM337 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM337 host target RNA into VGAM337 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9858] It is appreciated that VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM337 host target genes. The mRNA of each one of this plurality of VGAM337 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM337 RNA, herein designated VGAM RNA, and which when bound by VGAM337 RNA causes inhibition of translation of respective one or more VGAM337 host target proteins.

[9859] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM337 gene, herein designated VGAM GENE, on one or more VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9860] It is yet further appreciated that a function of VGAM337 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM337 correlate with, and may be deduced from, the identity of the host target genes which VGAM337 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9861] Nucleotide sequences of the VGAM337 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM337 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM337 are further described hereinbelow with reference to Table 1.

[9862] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM337 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM337 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9863] As mentioned hereinabove with reference to Fig. 1, a function of VGAM337 gene, herein designated VGAM is inhibition of expression of VGAM337 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM337 correlate with, and may be deduced from, the identity of the target genes which VGAM337 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9864] Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is a VGAM337 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:884, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:672.

[9865] A function of VGAM337 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006), a gene which Basic fibroblast growth factor 2. Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM30. M-phase Phosphoprotein 1 (MPHOSPH1, Accession NM_016195) is another VGAM337 host target gene. MPHOSPH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPHOSPH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MPHOSPH1 BINDING SITE, designated SEQ ID:1670, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:672.

[9866] Another function of VGAM337 is therefore inhibition of M-phase Phosphoprotein 1 (MPHOSPH1, Accession NM_016195), a gene which is Phosphorylated during M-phase and interacts with guanosine triphosphate. Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPHOSPH1. The function of MPHOSPH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM30.FLJ11274 (Accession NM_018375) is another VGAM337 host target gene. FLJ11274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11274 BINDING SITE, designated SEQ ID:1820, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:672.

[9867] Another function of VGAM337 is therefore inhibition of FLJ11274 (Accession NM_018375). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11274. FLJ31101 (Accession NM_017964) is another VGAM337 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:1771, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:672.

[9868] Another function of VGAM337 is therefore inhibition of FLJ31101 (Accession NM_017964). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31101. Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM_133443) is another VGAM337 host target gene. GPT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPT2, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPT2 BINDING SITE, designated SEQ ID:2417, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:672.

[9869] Another function of VGAM337 is therefore inhibition of Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM_133443). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPT2. RMP (Accession NM_134447) is another VGAM337 host target gene. RMP BINDING SITE1 and RMP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RMP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RMP BINDING SITE1 and RMP BINDING SITE2, designated SEQ ID:2430 and SEQ ID:1059 respectively, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:672.

[9870] Another function of VGAM337 is therefore inhibition of

RMP (Accession NM_134447). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RMP.

LOC136288 (Accession XM_059832) is another VGAM337 host target gene. LOC136288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC136288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136288 BINDING SITE, designated SEQ ID:3018, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:672.

[9871] Another function of VGAM337 is therefore inhibition of LOC136288 (Accession XM_059832). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 338 (VGAM338) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[9872] VGAM338 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM338 was detected is described hereinabove with reference to Figs. 1–8.

[9873] VGAM338 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9874] VGAM338 gene encodes a VGAM338 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM338 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM338 precursor RNA is designated SEQ ID:324, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:324 is located at position 188420 relative to the genome of Vaccinia Virus.

[9875] VGAM338 precursor RNA folds onto itself, forming VGAM338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[9876] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM338 folded precursor RNA into VGAM338 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 80%) nucleotide se-
quence of VGAM338 RNA is designated SEQ ID:673, and is
provided hereinbelow with reference to the sequence list-
ing part.

[9877] VGAM338 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM338 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM338 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[9878] VGAM338 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM338 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM338 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[9879] The complementary binding of VGAM338 RNA, herein designated VGAM RNA, to host target binding sites on VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM338 host target RNA into VGAM338 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9880] It is appreciated that VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM338 host target genes. The mRNA of each one of this plurality of VGAM338 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM338 RNA, herein designated VGAM RNA, and which when bound by VGAM338 RNA causes inhibition of translation of respective one or more VGAM338 host target proteins.

[9881] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM338 gene, herein designated VGAM GENE, on one or

more VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9882] It is yet further appreciated that a function of VGAM338 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM338 correlate with, and may be deduced from, the identity of the host target genes which VGAM338 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [9883] Nucleotide sequences of the VGAM338 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM338 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM338 are further described hereinbelow with reference to Table 1.
- [9884] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM338 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM338 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9885] As mentioned hereinabove with reference to Fig. 1, a function of VGAM338 gene, herein designated VGAM is inhibition of expression of VGAM338 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM338 correlate with, and may be deduced from, the identity of the target genes which VGAM338 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [9886] Activation-induced Cytidine Deaminase (AICDA, Accession

NM_020661) is a VGAM338 host target gene. AICDA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AICDA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AICDA BINDING SITE, designated SEQ ID:1922, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9887] A function of VGAM338 is therefore inhibition of Activation-induced Cytidine Deaminase (AICDA, Accession NM_020661), a gene which is a member of the cytidine deaminase family. Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AICDA. The function of AICDA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM31. AS3 (Accession NM_015928) is another VGAM338 host target gene. AS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of AS3 BINDING SITE, designated SEQ ID:1652, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9888] Another function of VGAM338 is therefore inhibition of AS3 (Accession NM_015928), a gene which inhibits cell proliferation. Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AS3. The function of AS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM31. Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM_005670) is another VGAM338 host target gene. EPM2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPM2A BINDING SITE, designated SEQ ID:1234, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9889] Another function of VGAM338 is therefore inhibition of Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM_005670), a gene which Laforin; protein tyrosine phosphatase that may have role in glycogen metabolism. Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPM2A. The function of EPM2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM31. Histamine Receptor H1 (HRH1, Accession NM_000861) is another VGAM338 host target gene. HRH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH1 BINDING SITE, designated SEQ ID:780, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9890] Another function of VGAM338 is therefore inhibition of Histamine Receptor H1 (HRH1, Accession NM_000861), a gene which stimulates the synthesis of inositol phosphate.

Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH1. The function of HRH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM31. Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_001315) is another VGAM338 host target gene. MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK14, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3, designated SEQ ID:818, SEQ ID:2465 and SEQ ID:2466 respectively, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9891] Another function of VGAM338 is therefore inhibition of Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_001315), a gene which is important for cytokine production; responds to changes in extracellular osmolarity. Accordingly, utilities of VGAM338 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with MAPK14. The function of MAPK14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM31. Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068) is another VGAM338 host target gene. SIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM1 BINDING SITE, designated SEQ ID:1181, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9892] Another function of VGAM338 is therefore inhibition of Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068), a gene which may have pleiotropic effects during embryogenesis and in the adult. Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM1. The function of SIM1 and its association with various diseases and clinical conditions, has been established

by previous studies, as described hereinabove with reference to VGAM31. Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418) is another VGAM338 host target gene. C11orf25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf25 BINDING SITE, designated SEQ ID:2193, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9893] Another function of VGAM338 is therefore inhibition of Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf25. DKFZP564D116 (Accession XM_051050) is another VGAM338 host target gene. DKFZP564D116 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of DKFZP564D116 BINDING SITE, designated SEQ ID:2938, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9894] Another function of VGAM338 is therefore inhibition of DKFZP564D116 (Accession XM_051050). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D116. Down Syndrome Critical Region Gene 6 (DSCR6, Accession NM_018962) is another VGAM338 host target gene. DSCR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR6 BINDING SITE, designated SEQ ID:1866, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9895] Another function of VGAM338 is therefore inhibition of Down Syndrome Critical Region Gene 6 (DSCR6, Accession NM_018962). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with DSCR6. FLJ10006 (Accession XM_087073) is another VGAM338 host target gene. FLJ10006 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10006 BINDING SITE, designated SEQ ID:3152, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9896] Another function of VGAM338 is therefore inhibition of FLJ10006 (Accession XM_087073). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10006. HTPAP (Accession NM_032483) is another VGAM338 host target gene. HTPAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTPAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTPAP BINDING SITE, designated SEQ ID:2255, to the nucleotide sequence of VGAM338 RNA,

herein designated VGAM RNA, also designated SEQ ID:673.

[9897] Another function of VGAM338 is therefore inhibition of HTPAP (Accession NM_032483). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTPAP. KIAA0979 (Accession NM_015032) is another VGAM338 host target gene. KIAA0979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0979 BINDING SITE, designated SEQ ID:1601, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9898] Another function of VGAM338 is therefore inhibition of KIAA0979 (Accession NM_015032). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0979. KIAA1634 (Accession XM_032749) is another VGAM338 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:2657, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9899] Another function of VGAM338 is therefore inhibition of KIAA1634 (Accession XM_032749). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. PTD012 (Accession NM_014039) is another VGAM338 host target gene. PTD012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTD012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTD012 BINDING SITE, designated SEQ ID:1465, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9900] Another function of VGAM338 is therefore inhibition of PTD012 (Accession NM_014039). Accordingly, utilities of

VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTD012. SAM Domain and HD Domain 1 (SAMHD1, Accession XM_028704) is another VGAM338 host target gene. SAMHD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SAMHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAMHD1 BINDING SITE, designated SEQ ID:2593, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9901] Another function of VGAM338 is therefore inhibition of SAM Domain and HD Domain 1 (SAMHD1, Accession XM_028704). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAMHD1. LOC196758 (Accession XM_113600) is another VGAM338 host target gene. LOC196758 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196758 BINDING SITE, designated SEQ ID:3410, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9902] Another function of VGAM338 is therefore inhibition of LOC196758 (Accession XM_113600). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196758. LOC219790 (Accession XM_166124) is another VGAM338 host target gene. LOC219790 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219790 BINDING SITE, designated SEQ ID:3520, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:673.

[9903] Another function of VGAM338 is therefore inhibition of LOC219790 (Accession XM_166124). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219790. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 339 (VGAM339) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9904] VGAM339 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM339 was detected is described hereinabove with reference to Figs. 1–8.

[9905] VGAM339 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9906] VGAM339 gene encodes a VGAM339 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM339 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM339 precursor RNA is designated SEQ ID:325, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:325 is located at position 190813 relative to the genome of Vaccinia Virus.

[9907] VGAM339 precursor RNA folds onto itself, forming VGAM339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9908] An enzyme complex designated DICER COMPLEX, `dices` the VGAM339 folded precursor RNA into VGAM339 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM339 RNA is designated SEQ ID:674, and is provided hereinbelow with reference to the sequence listing part.

[9909] VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM339 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9910] VGAM339 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM339 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM339 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9911] The complementary binding of VGAM339 RNA, herein designated VGAM RNA, to host target binding sites on VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM339 host target RNA into VGAM339 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9912] It is appreciated that VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM339 host target genes. The mRNA of each one of this plurality of VGAM339 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM339 RNA, herein designated VGAM RNA, and which when bound by VGAM339 RNA causes in-

hibition of translation of respective one or more VGAM339 host target proteins.

[9913] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM339 gene, herein designated VGAM GENE, on one or more VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9914] It is yet further appreciated that a function of VGAM339 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM339 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM339 correlate with, and may be deduced from, the identity of the host target genes which VGAM339 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [9915] Nucleotide sequences of the VGAM339 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM339 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM339 are further described hereinbelow with reference to Table 1.
- [9916] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM339 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM339 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9917] As mentioned hereinabove with reference to Fig. 1, a function of VGAM339 gene, herein designated VGAM is inhibition of expression of VGAM339 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM339 correlate with, and may be deduced from, the identity of the target genes which VGAM339 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9918] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM339 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:674.

[9919] A function of VGAM339 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM339 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:674.

[9920] Another function of VGAM339 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM339 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:674.

[9921] Another function of VGAM339 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM339 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ

ID:674.

[9922] Another function of VGAM339 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM339 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:674.

[9923] Another function of VGAM339 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM339 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:674.

[9924] Another function of VGAM339 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM339 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:674.

[9925] Another function of VGAM339 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 340 (VGAM340) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9926] VGAM340 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM340 was detected is described hereinabove with reference to Figs. 1–8.

[9927] VGAM340 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9928] VGAM340 gene encodes a VGAM340 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM340 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM340 precursor RNA is designated SEQ

ID:326, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:326 is located at position 188778 relative to the genome of Vaccinia Virus.

[9929] VGAM340 precursor RNA folds onto itself, forming VGAM340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9930] An enzyme complex designated DICER COMPLEX, `dices` the VGAM340 folded precursor RNA into VGAM340 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM340 RNA is designated SEQ ID:675, and is provided hereinbelow with reference to the sequence list-

ing part.

[9931] VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM340 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9932] VGAM340 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM340 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM340 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9933] The complementary binding of VGAM340 RNA, herein designated VGAM RNA, to host target binding sites on VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM340 host target RNA into VGAM340 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9934] It is appreciated that VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM340 host target genes. The mRNA of each one of this plurality of VGAM340 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM340 RNA, herein designated VGAM

RNA, and which when bound by VGAM340 RNA causes inhibition of translation of respective one or more VGAM340 host target proteins.

[9935] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM340 gene, herein designated VGAM GENE, on one or more VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9936] It is yet further appreciated that a function of VGAM340 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM340 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM340 correlate with, and may be deduced from, the identity of the host target genes which VGAM340 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9937] Nucleotide sequences of the VGAM340 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM340 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM340 are further described hereinbelow with reference to Table 1.

[9938] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM340 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM340 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9939] As mentioned hereinabove with reference to Fig. 1, a function of VGAM340 gene, herein designated VGAM is

inhibition of expression of VGAM340 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM340 correlate with, and may be deduced from, the identity of the target genes which VGAM340 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9940] Adenylate Cyclase 6 (ADCY6, Accession NM_015270) is a VGAM340 host target gene. ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADCY6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2, designated SEQ ID:1617 and SEQ ID:1933 respectively, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9941] A function of VGAM340 is therefore inhibition of Adenylate Cyclase 6 (ADCY6, Accession NM_015270), a gene which this a membrane-bound, Ca^{2+} -inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ADCY6. The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM34. ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933) is another VGAM340 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:2716, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9942] Another function of VGAM340 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM_001712) is another VGAM340 host target gene. CEACAM1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEACAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM1 BINDING SITE, designated SEQ ID:848, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9943] Another function of VGAM340 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM_001712), a gene which is a major effector of VEGF and may be a target for the inhibition of tumor angiogenesis. Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM1. The function of CEACAM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM34. Carbohydrate (keratan sulfate Gal-6) Sulfotransferase 1 (CHST1, Accession NM_003654) is another VGAM340 host target gene. CHST1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by CHST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST1 BINDING SITE, designated SEQ ID:1046, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9944] Another function of VGAM340 is therefore inhibition of Carbohydrate (keratan sulfate Gal-6) Sulfotransferase 1 (CHST1, Accession NM_003654), a gene which may play a role in keratan sulfate biosynthesis in brain and cornea. Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST1. The function of CHST1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM34.F-box and Leucine-rich Repeat Protein 7 (FBXL7, Accession NM_012304) is another VGAM340 host target gene. FBXL7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FBXL7 BINDING SITE, designated SEQ ID:1425, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9945] Another function of VGAM340 is therefore inhibition of F-box and Leucine-rich Repeat Protein 7 (FBXL7, Accession NM_012304), a gene which may be involved in in phosphorylation-dependent ubiquitination. Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL7. The function of FBXL7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM34. Homeo Box C9 (HOXC9, Accession XM_028620) is another VGAM340 host target gene. HOXC9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXC9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC9 BINDING SITE, designated SEQ ID:2592, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ

ID:675.

[9946] Another function of VGAM340 is therefore inhibition of Homeo Box C9 (HOXC9, Accession XM_028620). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC9. Insulin-like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618) is another VGAM340 host target gene. IGF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF1 BINDING SITE, designated SEQ ID:763, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9947] Another function of VGAM340 is therefore inhibition of Insulin-like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618), a gene which are structurally and functionally related to insulin but have a much higher growth-promoting activity. Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF1. The

function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM34. Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209) is another VGAM340 host target gene. ITGAL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAL BINDING SITE, designated SEQ ID:907, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9948] Another function of VGAM340 is therefore inhibition of Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209), a gene which is a receptor for icam1, icam2, icam3 and icam4. It is involved in a variety of immune phenomena including leukocyte-endothelial cell interaction, cytotoxic t-cell mediated killing, and antibody dependent killing by granulocytes and monocytes.

Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAL. The function of ITGAL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM34. Lamin B Receptor (LBR, Accession XM_001795) is another VGAM340 host target gene. LBR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LBR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBR BINDING SITE, designated SEQ ID:2522, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9949] Another function of VGAM340 is therefore inhibition of Lamin B Receptor (LBR, Accession XM_001795). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBR. Major Intrinsic Protein of Lens Fiber (MIP, Accession NM_012064) is another VGAM340 host target gene. MIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

MIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIP BINDING SITE, designated SEQ ID:1399, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9950] Another function of VGAM340 is therefore inhibition of Major Intrinsic Protein of Lens Fiber (MIP, Accession NM_012064). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIP. Relaxin 2 (H2) (RLN2, Accession NM_005059) is another VGAM340 host target gene. RLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RLN2 BINDING SITE, designated SEQ ID:1175, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9951] Another function of VGAM340 is therefore inhibition of Relaxin 2 (H2) (RLN2, Accession NM_005059). Accordingly, utilities of VGAM340 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with RLN2. SART2 (Accession NM_013352) is another VGAM340 host target gene. SART2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SART2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SART2 BINDING SITE, designated SEQ ID:1444, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9952] Another function of VGAM340 is therefore inhibition of SART2 (Accession NM_013352). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SART2. Thiamin Pyrophosphokinase 1 (TPK1, Accession NM_022445) is another VGAM340 host target gene. TPK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPK1 BINDING SITE, designated SEQ ID:1987, to the nu-

cleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9953] Another function of VGAM340 is therefore inhibition of Thiamin Pyrophosphokinase 1 (TPK1, Accession NM_022445), a gene which catalyzes the conversion of thiamine, a form of vitamin B1, to thiamine pyrophosphate . Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPK1. The function of TPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM34. Thyroid Hormone Receptor Interactor 12 (TRIP12, Accession NM_004238) is another VGAM340 host target gene. TRIP12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIP12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP12 BINDING SITE, designated SEQ ID:1094, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9954] Another function of VGAM340 is therefore inhibition of

Thyroid Hormone Receptor Interactor 12 (TRIP12, Accession NM_004238), a gene which interacts with the ligand binding domain of the thyroid hormone receptor (in a thyroid hormone t3-independent manner) and with retinoid x receptor (rxr). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP12. The function of TRIP12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM34. Bromodomain Containing 3 (BRD3, Accession NM_007371) is another VGAM340 host target gene. BRD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD3 BINDING SITE, designated SEQ ID:1398, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9955] Another function of VGAM340 is therefore inhibition of Bromodomain Containing 3 (BRD3, Accession NM_007371). Accordingly, utilities of VGAM340 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD3. FLJ13397 (Accession NM_024948) is another VGAM340 host target gene.

FLJ13397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13397 BINDING SITE, designated SEQ ID:2116, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9956] Another function of VGAM340 is therefore inhibition of FLJ13397 (Accession NM_024948). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13397. FLJ22202 (Accession NM_024883) is another VGAM340 host target gene. FLJ22202 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22202 BINDING SITE,

designated SEQ ID:2103, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9957] Another function of VGAM340 is therefore inhibition of FLJ22202 (Accession NM_024883). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22202. GROS1 (Accession NM_022356) is another VGAM340 host target gene. GROS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GROS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GROS1 BINDING SITE, designated SEQ ID:1986, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9958] Another function of VGAM340 is therefore inhibition of GROS1 (Accession NM_022356). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GROS1. KIAA0981 (Accession XM_028867) is another VGAM340 host target gene. KIAA0981 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0981 BINDING SITE, designated SEQ ID:2598, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9959] Another function of VGAM340 is therefore inhibition of KIAA0981 (Accession XM_028867). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0981. KIAA1243 (Accession XM_057057) is another VGAM340 host target gene. KIAA1243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1243 BINDING SITE, designated SEQ ID:2978, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9960] Another function of VGAM340 is therefore inhibition of

KIAA1243 (Accession XM_057057). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1243. KIAA1462 (Accession XM_166132) is another VGAM340 host target gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:3524, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9961] Another function of VGAM340 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. MGC1136 (Accession NM_024025) is another VGAM340 host target gene. MGC1136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC1136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC1136 BINDING SITE, designated SEQ ID:2041, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9962] Another function of VGAM340 is therefore inhibition of MGC1136 (Accession NM_024025). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1136. MSTP043 (Accession NM_031953) is another VGAM340 host target gene. MSTP043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSTP043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP043 BINDING SITE, designated SEQ ID:2223, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9963] Another function of VGAM340 is therefore inhibition of MSTP043 (Accession NM_031953). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP043. Nup43 (Accession NM_024647) is another VGAM340 host

target gene. Nup43 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Nup43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nup43 BINDING SITE, designated SEQ ID:2075, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9964] Another function of VGAM340 is therefore inhibition of Nup43 (Accession NM_024647). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nup43. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942) is another VGAM340 host target gene. RPS6KA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPS6KA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA4 BINDING SITE, designated SEQ ID:1072, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:675.

[9965] Another function of VGAM340 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA4. Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM_020346) is another VGAM340 host target gene. SLC17A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A6 BINDING SITE, designated SEQ ID:1911, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9966] Another function of VGAM340 is therefore inhibition of Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM_020346). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SLC17A6. TERA (Accession NM_021238) is another VGAM340 host target gene. TERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERA BINDING SITE, designated SEQ ID:1949, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9967] Another function of VGAM340 is therefore inhibition of TERA (Accession NM_021238). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERA. Vav 3 Oncogene (VAV3, Accession NM_006113) is another VGAM340 host target gene. VAV3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAV3 BINDING SITE, designated SEQ ID:1273, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:675.

[9968] Another function of VGAM340 is therefore inhibition of Vav 3 Oncogene (VAV3, Accession NM_006113). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAV3. LOC120892 (Accession XM_058513) is another VGAM340 host target gene. LOC120892 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120892 BINDING SITE, designated SEQ ID:2987, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9969] Another function of VGAM340 is therefore inhibition of LOC120892 (Accession XM_058513). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120892. LOC155434 (Accession XM_098723) is another VGAM340 host target gene. LOC155434 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155434, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155434 BINDING SITE, designated SEQ ID:3376, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9970] Another function of VGAM340 is therefore inhibition of LOC155434 (Accession XM_098723). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155434. LOC169966 (Accession XM_093010) is another VGAM340 host target gene. LOC169966 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169966 BINDING SITE, designated SEQ ID:3252, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9971] Another function of VGAM340 is therefore inhibition of LOC169966 (Accession XM_093010). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC169966. LOC221272 (Accession XM_168050) is another VGAM340 host target gene. LOC221272 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221272 BINDING SITE, designated SEQ ID:3616, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9972] Another function of VGAM340 is therefore inhibition of LOC221272 (Accession XM_168050). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221272. LOC221968 (Accession XM_166524) is another VGAM340 host target gene. LOC221968 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221968, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221968 BINDING SITE, designated SEQ ID:3569, to

the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9973] Another function of VGAM340 is therefore inhibition of LOC221968 (Accession XM_166524). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221968. LOC86651 (Accession XM_044052) is another VGAM340 host target gene. LOC86651 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC86651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC86651 BINDING SITE, designated SEQ ID:2830, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9974] Another function of VGAM340 is therefore inhibition of LOC86651 (Accession XM_044052). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC86651. LOC90322 (Accession XM_030903) is another VGAM340 host target gene. LOC90322 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC90322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90322 BINDING SITE, designated SEQ ID:2632, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:675.

[9975] Another function of VGAM340 is therefore inhibition of LOC90322 (Accession XM_030903). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90322. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 341 (VGAM341) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9976] VGAM341 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM341 was detected is described hereinabove with reference to Figs. 1–8.

[9977] VGAM341 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9978] VGAM341 gene encodes a VGAM341 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM341 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM341 precursor RNA is designated SEQ ID:327, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:327 is located at position 642 relative to the genome of Vaccinia Virus.

[9979] VGAM341 precursor RNA folds onto itself, forming VGAM341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9980] An enzyme complex designated DICER COMPLEX, `dices` the VGAM341 folded precursor RNA into VGAM341 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM341 RNA is designated SEQ ID:676, and is provided hereinbelow with reference to the sequence listing part.

[9981] VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM341 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9982] VGAM341 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM341 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM341 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9983] The complementary binding of VGAM341 RNA, herein designated VGAM RNA, to host target binding sites on VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM341 host tar-

get RNA into VGAM341 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9984] It is appreciated that VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM341 host target genes. The mRNA of each one of this plurality of VGAM341 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM341 RNA, herein designated VGAM RNA, and which when bound by VGAM341 RNA causes inhibition of translation of respective one or more VGAM341 host target proteins.

[9985] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM341 gene, herein designated VGAM GENE, on one or more VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9986] It is yet further appreciated that a function of VGAM341 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM341 correlate with, and may be deduced from, the identity of the host target genes which VGAM341 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9987] Nucleotide sequences of the VGAM341 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM341 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM341 are further

described hereinbelow with reference to Table 1.

[9988] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM341 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM341 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9989] As mentioned hereinabove with reference to Fig. 1, a function of VGAM341 gene, herein designated VGAM is inhibition of expression of VGAM341 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM341 correlate with, and may be deduced from, the identity of the target genes which VGAM341 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9990] Myosin IE (MYO1E, Accession NM_004998) is a VGAM341 host target gene. MYO1E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYO1E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1E BINDING SITE, des-

ignated SEQ ID:1168, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:676.

[9991] A function of VGAM341 is therefore inhibition of Myosin IE (MYO1E, Accession NM_004998), a gene which is an unconventional myosin. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1E. The function of MYO1E and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35. Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM_038377) is another VGAM341 host target gene. ROCK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROCK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROCK2 BINDING SITE, designated SEQ ID:2737, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:676.

[9992] Another function of VGAM341 is therefore inhibition of

Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM_038377), a gene which regulates cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROCK2. The function of ROCK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35. MGC15937 (Accession NM_080661) is another VGAM341 host target gene. MGC15937 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15937 BINDING SITE, designated SEQ ID:2383, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:676.

[9993] Another function of VGAM341 is therefore inhibition of MGC15937 (Accession NM_080661). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC15937. Serine/threonine Kinase 16 (STK16, Accession XM_050904) is another VGAM341 host target gene. STK16 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by STK16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK16 BINDING SITE, designated SEQ ID:2937, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:676.

[9994] Another function of VGAM341 is therefore inhibition of Serine/threonine Kinase 16 (STK16, Accession XM_050904). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK16. LOC148029 (Accession XM_086014) is another VGAM341 host target gene. LOC148029 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148029 BINDING SITE, designated SEQ ID:3116, to the nucleotide sequence of

VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:676.

[9995] Another function of VGAM341 is therefore inhibition of LOC148029 (Accession XM_086014). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148029. LOC169436 (Accession XM_095696) is another VGAM341 host target gene. LOC169436 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169436 BINDING SITE, designated SEQ ID:3261, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:676.

[9996] Another function of VGAM341 is therefore inhibition of LOC169436 (Accession XM_095696). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169436. LOC256267 (Accession XM_173007) is another VGAM341 host target gene. LOC256267 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC256267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256267 BINDING SITE, designated SEQ ID:3713, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:676.

[9997] Another function of VGAM341 is therefore inhibition of LOC256267 (Accession XM_173007). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256267. LOC257426 (Accession XM_039451) is another VGAM341 host target gene. LOC257426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257426 BINDING SITE, designated SEQ ID:2755, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:676.

[9998] Another function of VGAM341 is therefore inhibition of LOC257426 (Accession XM_039451). Accordingly, utilities

of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257426. LOC92466 (Accession XM_045251) is another VGAM341 host target gene. LOC92466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92466 BINDING SITE, designated SEQ ID:2858, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:676.

[9999] Another function of VGAM341 is therefore inhibition of LOC92466 (Accession XM_045251). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92466. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 342 (VGAM342) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10000] VGAM342 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM342 was detected is described hereinabove with reference to Figs. 1–8.

[10001] VGAM342 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10002] VGAM342 gene encodes a VGAM342 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM342 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM342 precursor RNA is designated SEQ ID:328, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:328 is located at position 3549 relative to the genome of Vaccinia Virus.

[10003] VGAM342 precursor RNA folds onto itself, forming VGAM342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10004] An enzyme complex designated DICER COMPLEX, `dices` the VGAM342 folded precursor RNA into VGAM342 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM342 RNA is designated SEQ ID:677, and is provided hereinbelow with reference to the sequence listing part.

[10005] VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM342 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[10006] VGAM342 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM342 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM342 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10007] The complementary binding of VGAM342 RNA, herein designated VGAM RNA, to host target binding sites on VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM342 host target RNA into VGAM342 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10008] It is appreciated that VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM342 host target genes. The mRNA of each one of this plurality of VGAM342 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM342 RNA, herein designated VGAM RNA, and which when bound by VGAM342 RNA causes inhibition of translation of respective one or more VGAM342 host target proteins.

[10009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM342 gene, herein designated VGAM GENE, on one or more VGAM342 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10010] It is yet further appreciated that a function of VGAM342 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM342 correlate with, and may be deduced from, the identity of the host target genes which VGAM342 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10011] Nucleotide sequences of the VGAM342 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM342 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM342 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM342 are further
described hereinbelow with reference to Table 1.

[10012] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM342 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM342 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[10013] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM342 gene, herein designated VGAM is
inhibition of expression of VGAM342 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM342 correlate with, and may be deduced
from, the identity of the target genes which VGAM342
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[10014] Membrane Metallo-endopeptidase (neutral endopepti-
dase, enkephalinase, CALLA, CD10) (MME, Accession

NM_000902) is a VGAM342 host target gene. MME BINDING SITE1 through MME BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MME, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE1 through MME BINDING SITE4, designated SEQ ID:785, SEQ ID:1377, SEQ ID:1378 and SEQ ID:1379 respectively, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:677.

[10015] A function of VGAM342 is therefore inhibition of Membrane Metallo-endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_000902), a gene which is thermolysin-like specificity. Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MME. The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36.FLJ11275 (Accession NM_018376) is another VGAM342 host target gene. FLJ11275 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by FLJ11275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11275 BINDING SITE, designated SEQ ID:1821, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:677.

[10016] Another function of VGAM342 is therefore inhibition of FLJ11275 (Accession NM_018376). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11275. Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130) is another VGAM342 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH3 BINDING SITE, designated SEQ ID:1981, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:677.

[10017] Another function of VGAM342 is therefore inhibition of Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH3. KIAA0563 (Accession NM_014834) is another VGAM342 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:1565, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:677.

[10018] Another function of VGAM342 is therefore inhibition of KIAA0563 (Accession NM_014834). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563. TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 150kDa (TAF2, Accession NM_003184) is another VGAM342 host target gene. TAF2 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by TAF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF2 BINDING SITE, designated SEQ ID:997, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:677.

[10019] Another function of VGAM342 is therefore inhibition of TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 150kDa (TAF2, Accession NM_003184). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF2. LOC147071 (Accession XM_054031) is another VGAM342 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:2965, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:677.

[10020] Another function of VGAM342 is therefore inhibition of LOC147071 (Accession XM_054031). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC147639 (Accession XM_085822) is another VGAM342 host target gene. LOC147639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147639 BINDING SITE, designated SEQ ID:3110, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:677.

[10021] Another function of VGAM342 is therefore inhibition of LOC147639 (Accession XM_085822). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147639. LOC201173 (Accession XM_113312) is another VGAM342 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201173, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:3405, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:677.

[10022] Another function of VGAM342 is therefore inhibition of LOC201173 (Accession XM_113312). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC201220 (Accession XM_113321) is another VGAM342 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201220 BINDING SITE, designated SEQ ID:3406, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:677.

[10023] Another function of VGAM342 is therefore inhibition of LOC201220 (Accession XM_113321). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201220. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 343 (VGAM343) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10024] VGAM343 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM343 was detected is described hereinabove with reference to Figs. 1–8.

[10025] VGAM343 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10026] VGAM343 gene encodes a VGAM343 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM343 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM343 precursor RNA is designated SEQ ID:329, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:329 is located at position 3549 relative to the genome of Vaccinia Virus.

[10027] VGAM343 precursor RNA folds onto itself, forming VGAM343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10028] An enzyme complex designated DICER COMPLEX, `dices` the VGAM343 folded precursor RNA into VGAM343 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM343 RNA is designated SEQ ID:678, and is provided hereinbelow with reference to the sequence listing part.

[10029] VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM343 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10030] VGAM343 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM343 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM343 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10031] The complementary binding of VGAM343 RNA, herein designated VGAM RNA, to host target binding sites on VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM343 host target RNA into VGAM343 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10032] It is appreciated that VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM343 host target genes. The mRNA of each one of this plurality of VGAM343 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM343 RNA, herein designated VGAM RNA, and which when bound by VGAM343 RNA causes in-

hibition of translation of respective one or more VGAM343 host target proteins.

[10033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM343 gene, herein designated VGAM GENE, on one or more VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10034] It is yet further appreciated that a function of VGAM343 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM343 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM343 correlate with, and may be deduced from, the identity of the host target genes which VGAM343 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [10035] Nucleotide sequences of the VGAM343 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM343 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM343 are further described hereinbelow with reference to Table 1.
- [10036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM343 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM343 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [10037] As mentioned hereinabove with reference to Fig. 1, a function of VGAM343 gene, herein designated VGAM is inhibition of expression of VGAM343 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM343 correlate with, and may be deduced from, the identity of the target genes which VGAM343 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10038] Membrane Metallo–endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_000902) is a VGAM343 host target gene. MME BINDING SITE1 through MME BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MME, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE1 through MME BINDING SITE4, designated SEQ ID:785, SEQ ID:1377, SEQ ID:1378 and SEQ ID:1379 respectively, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:678.

[10039] A function of VGAM343 is therefore inhibition of Membrane Metallo–endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_000902), a gene which is thermolysin–like specificity. Accordingly, utilities of VGAM343 include diagnosis, pre–

vention and treatment of diseases and clinical conditions associated with MME. The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36.FLJ11275 (Accession NM_018376) is another VGAM343 host target gene. FLJ11275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11275 BINDING SITE, designated SEQ ID:1821, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:678.

[10040] Another function of VGAM343 is therefore inhibition of FLJ11275 (Accession NM_018376). Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11275. Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130) is another VGAM343 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

GOLPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH3 BINDING SITE, designated SEQ ID:1981, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:678.

[10041] Another function of VGAM343 is therefore inhibition of Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130). Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH3. KIAA0563 (Accession NM_014834) is another VGAM343 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:1565, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:678.

[10042] Another function of VGAM343 is therefore inhibition of

KIAA0563 (Accession NM_014834). Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563. TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 150kDa (TAF2, Accession NM_003184) is another VGAM343 host target gene. TAF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF2 BINDING SITE, designated SEQ ID:997, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:678.

[10043] Another function of VGAM343 is therefore inhibition of TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 150kDa (TAF2, Accession NM_003184). Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF2. LOC147071 (Accession XM_054031) is another VGAM343 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:2965, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:678.

[10044] Another function of VGAM343 is therefore inhibition of LOC147071 (Accession XM_054031). Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC147639 (Accession XM_085822) is another VGAM343 host target gene. LOC147639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147639 BINDING SITE, designated SEQ ID:3110, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:678.

[10045] Another function of VGAM343 is therefore inhibition of LOC147639 (Accession XM_085822). Accordingly, utilities

of VGAM343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147639. LOC201173 (Accession XM_113312) is another VGAM343 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:3405, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:678.

[10046] Another function of VGAM343 is therefore inhibition of LOC201173 (Accession XM_113312). Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC201220 (Accession XM_113321) is another VGAM343 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC201220 BINDING SITE, designated SEQ ID:3406, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:678.

[10047] Another function of VGAM343 is therefore inhibition of LOC201220 (Accession XM_113321). Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201220. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 344 (VGAM344) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10048] VGAM344 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM344 was detected is described hereinabove with reference to Figs. 1–8.

[10049] VGAM344 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM344 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10050] VGAM344 gene encodes a VGAM344 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM344 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM344 precursor RNA is designated SEQ ID:330, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:330 is located at position 2981 relative to the genome of Vaccinia Virus.

[10051] VGAM344 precursor RNA folds onto itself, forming VGAM344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10052] An enzyme complex designated DICER COMPLEX, `dices` the VGAM344 folded precursor RNA into VGAM344 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM344 RNA is designated SEQ ID:679, and is provided hereinbelow with reference to the sequence listing part.

[10053] VGAM344 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM344 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[10054] VGAM344 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM344 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM344 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[10055] The complementary binding of VGAM344 RNA, herein designated VGAM RNA, to host target binding sites on VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM344 host target RNA into VGAM344 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10056] It is appreciated that VGAM344 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM344 host target genes. The mRNA of each one of this plurality of VGAM344 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM344 RNA, herein designated VGAM RNA, and which when bound by VGAM344 RNA causes inhibition of translation of respective one or more VGAM344 host target proteins.

[10057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM344 gene, herein designated VGAM GENE, on one or more VGAM344 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[10058] It is yet further appreciated that a function of VGAM344 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM344 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM344 correlate with, and may be deduced from, the identity of the host target genes which VGAM344 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10059] Nucleotide sequences of the VGAM344 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM344 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM344 are further described hereinbelow with reference to Table 1.

[10060] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM344 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM344 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10061] As mentioned hereinabove with reference to Fig. 1, a function of VGAM344 gene, herein designated VGAM is inhibition of expression of VGAM344 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM344 correlate with, and may be deduced from, the identity of the target genes which VGAM344 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10062] MAP/microtubule Affinity-regulating Kinase 1 (MARK1, Accession NM_018650) is a VGAM344 host target gene. MARK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MARK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARK1 BINDING SITE, designated SEQ ID:1857, to the nucleotide sequence of VGAM344 RNA, herein designated VGAM RNA, also designated SEQ ID:679.

[10063] A function of VGAM344 is therefore inhibition of MAP/microtubule Affinity-regulating Kinase 1 (MARK1, Accession NM_018650), a gene which phosphorylate microtubule-associated proteins and trigger microtubule disruption. Accordingly, utilities of VGAM344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARK1. The function of MARK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM38. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 345 (VGAM345) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10064] VGAM345 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM345 was detected is described hereinabove with reference to Figs. 1-8.

[10065] VGAM345 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM345 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[10066] VGAM345 gene encodes a VGAM345 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM345 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM345 precursor RNA is designated SEQ ID:331, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:331 is located at position 963 relative to the genome of Vaccinia Virus.

[10067] VGAM345 precursor RNA folds onto itself, forming VGAM345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10068] An enzyme complex designated DICER COMPLEX, `dices` the VGAM345 folded precursor RNA into VGAM345 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM345 RNA is designated SEQ ID:680, and is provided hereinbelow with reference to the sequence listing part.

[10069] VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM345 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10070] VGAM345 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM345 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM345 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10071] The complementary binding of VGAM345 RNA, herein designated VGAM RNA, to host target binding sites on VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM345 host target RNA into VGAM345 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[10072] It is appreciated that VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM345 host target genes. The mRNA of each one of this plurality of VGAM345 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM345 RNA, herein designated VGAM RNA, and which when bound by VGAM345 RNA causes inhibition of translation of respective one or more VGAM345 host target proteins.

[10073] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM345 gene, herein designated VGAM GENE, on one or more VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10074] It is yet further appreciated that a function of VGAM345 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM345 correlate with, and may be deduced from, the identity of the host target genes which VGAM345 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10075] Nucleotide sequences of the VGAM345 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM345 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM345 are further described hereinbelow with reference to Table 1.

[10076] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM345 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM345 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10077] As mentioned hereinabove with reference to Fig. 1, a function of VGAM345 gene, herein designated VGAM is inhibition of expression of VGAM345 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM345 correlate with, and may be deduced from, the identity of the target genes which VGAM345 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10078] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM345 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM

RNA, also designated SEQ ID:680.

[10079] A function of VGAM345 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is another VGAM345 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:680.

[10080] Another function of VGAM345 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal

transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM345 host target gene.

PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:680.

[10081] Another function of VGAM345 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM345 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM345 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:680.

[10082] Another function of VGAM345 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its asso-

ciation with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM39.DKFZP564I0422 (Accession NM_031435) is another VGAM345 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:680.

[10083] Another function of VGAM345 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM345 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:680.

[10084] Another function of VGAM345 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM345 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:680.

[10085] Another function of VGAM345 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM345 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:680.

[10086] Another function of VGAM345 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM345 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:680.

[10087] Another function of VGAM345 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM345 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:680.

[10088] Another function of VGAM345 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM345 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:680.

[10089] Another function of VGAM345 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 346 (VGAM346) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10090] VGAM346 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM346 was detected is described hereinabove with reference to Figs. 1–8.

[10091] VGAM346 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10092] VGAM346 gene encodes a VGAM346 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM346 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM346 precursor RNA is designated SEQ ID:332, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:332 is located at position 963 relative to the genome of Vaccinia Virus.

[10093] VGAM346 precursor RNA folds onto itself, forming VGAM346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10094] An enzyme complex designated DICER COMPLEX, `dices` the VGAM346 folded precursor RNA into VGAM346 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM346 RNA is designated SEQ ID:681, and is provided hereinbelow with reference to the sequence listing part.

[10095] VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM346 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10096] VGAM346 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM346 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM346 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10097] The complementary binding of VGAM346 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM346 host target RNA into VGAM346 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10098] It is appreciated that VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM346 host target genes. The mRNA of each one of this plurality of VGAM346 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM346 RNA, herein designated VGAM RNA, and which when bound by VGAM346 RNA causes inhibition of translation of respective one or more VGAM346 host target proteins.

[10099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM346 gene, herein designated VGAM GENE, on one or more VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10100] It is yet further appreciated that a function of VGAM346 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM346 correlate with, and may be deduced from, the identity of the host target genes which VGAM346 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10101] Nucleotide sequences of the VGAM346 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM346 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM346 are further described hereinbelow with reference to Table 1.

[10102] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM346 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM346 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10103] As mentioned hereinabove with reference to Fig. 1, a function of VGAM346 gene, herein designated VGAM is inhibition of expression of VGAM346 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM346 correlate with, and may be deduced from, the identity of the target genes which VGAM346 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10104] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM346 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:681.

[10105] A function of VGAM346 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is another VGAM346 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BIND-

ING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:681.

[10106] Another function of VGAM346 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM346 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ

ID:681.

[10107] Another function of VGAM346 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM346 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:681.

[10108] Another function of VGAM346 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Ac-

cession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.DKFZP564I0422

(Accession NM_031435) is another VGAM346 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:681.

[10109] Another function of VGAM346 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM346 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:681.

[10110] Another function of VGAM346 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM346 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated

SEQ ID:1990, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:681.

[10111] Another function of VGAM346 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM346 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:681.

[10112] Another function of VGAM346 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E,

Accession NM_012431) is another VGAM346 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:681.

[10113] Another function of VGAM346 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM346 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, desig-

nated SEQ ID:3011, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:681.

[10114] Another function of VGAM346 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM346 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:681.

[10115] Another function of VGAM346 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 347 (VGAM347) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10116] VGAM347 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM347 was detected is described hereinabove with reference to Figs. 1–8.

[10117] VGAM347 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10118] VGAM347 gene encodes a VGAM347 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM347 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM347 precursor RNA is designated SEQ ID:333, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:333 is located at position 963 relative to the genome of Vaccinia

Virus.

[10119] VGAM347 precursor RNA folds onto itself, forming VGAM347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10120] An enzyme complex designated DICER COMPLEX, `dices` the VGAM347 folded precursor RNA into VGAM347 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM347 RNA is designated SEQ ID:682, and is provided hereinbelow with reference to the sequence listing part.

[10121] VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM347 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10122] VGAM347 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM347 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM347 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10123] The complementary binding of VGAM347 RNA, herein designated VGAM RNA, to host target binding sites on VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM347 host target RNA into VGAM347 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10124] It is appreciated that VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM347 host target genes. The mRNA of each one of this plurality of VGAM347 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM347 RNA, herein designated VGAM RNA, and which when bound by VGAM347 RNA causes inhibition of translation of respective one or more VGAM347 host target proteins.

[10125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM347 gene, herein designated VGAM GENE, on one or more VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10126] It is yet further appreciated that a function of VGAM347 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM347 correlate

with, and may be deduced from, the identity of the host target genes which VGAM347 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10127] Nucleotide sequences of the VGAM347 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM347 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM347 are further described hereinbelow with reference to Table 1.

[10128] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM347 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM347 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10129] As mentioned hereinabove with reference to Fig. 1, a function of VGAM347 gene, herein designated VGAM is inhibition of expression of VGAM347 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM347 correlate with, and may be deduced

from, the identity of the target genes which VGAM347 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10130] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM347 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10131] A function of VGAM347 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is an-

other VGAM347 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10132] Another function of VGAM347 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM347 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10133] Another function of VGAM347 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM347 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10134] Another function of VGAM347 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.DKFZP564I0422 (Accession NM_031435) is another VGAM347 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide

sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10135] Another function of VGAM347 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM347 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10136] Another function of VGAM347 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM347 host target

gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10137] Another function of VGAM347 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM347 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10138] Another function of VGAM347 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM347 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10139] Another function of VGAM347 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM347 host target

gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10140] Another function of VGAM347 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM347 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:682.

[10141] Another function of VGAM347 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 348 (VGAM348) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10142] VGAM348 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM348 was detected is described hereinabove with reference to Figs. 1–8.

[10143] VGAM348 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10144] VGAM348 gene encodes a VGAM348 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM348

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM348 precursor RNA is designated SEQ ID:334, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:334 is located at position 963 relative to the genome of Vaccinia Virus.

[10145] VGAM348 precursor RNA folds onto itself, forming VGAM348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10146] An enzyme complex designated DICER COMPLEX, `dices` the VGAM348 folded precursor RNA into VGAM348 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 92%) nucleotide sequence of VGAM348 RNA is designated SEQ ID:683, and is provided hereinbelow with reference to the sequence listing part.

[10147] VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM348 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[10148] VGAM348 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM348 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM348 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10149] The complementary binding of VGAM348 RNA, herein designated VGAM RNA, to host target binding sites on VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM348 host target RNA into VGAM348 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10150] It is appreciated that VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM348 host target genes. The mRNA of each one of this plurality of VGAM348 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM348 RNA, herein designated VGAM RNA, and which when bound by VGAM348 RNA causes inhibition of translation of respective one or more VGAM348 host target proteins.

[10151] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM348 gene, herein designated VGAM GENE, on one or more VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10152] It is yet further appreciated that a function of VGAM348 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM348 correlate with, and may be deduced from, the identity of the host target genes which VGAM348 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10153] Nucleotide sequences of the VGAM348 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM348 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM348 are further described hereinbelow with reference to Table 1.

[10154] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM348 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM348 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[10155] As mentioned hereinabove with reference to Fig. 1, a function of VGAM348 gene, herein designated VGAM is inhibition of expression of VGAM348 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM348 correlate with, and may be deduced from, the identity of the target genes which VGAM348 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10156] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM348 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10157] A function of VGAM348 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM348 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is another VGAM348 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10158] Another function of VGAM348 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM348 host target gene.

PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10159] Another function of VGAM348 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. S100 Calcium Binding

Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM348 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10160] Another function of VGAM348 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.DKFZP564I0422 (Accession NM_031435) is another VGAM348 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10161] Another function of VGAM348 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM348 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10162] Another function of VGAM348 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM348 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10163] Another function of VGAM348 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM348 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10164] Another function of VGAM348 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM348 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10165] Another function of VGAM348 is therefore inhibition of

Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM348 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10166] Another function of VGAM348 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM348 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:683.

[10167] Another function of VGAM348 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 349 (VGAM349) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10168] VGAM349 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM349 was detected is described hereinabove with reference to Figs. 1–8.

[10169] VGAM349 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10170] VGAM349 gene encodes a VGAM349 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM349 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM349 precursor RNA is designated SEQ ID:335, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:335 is located at position 963 relative to the genome of Vaccinia Virus.

[10171] VGAM349 precursor RNA folds onto itself, forming VGAM349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10172] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM349 folded precursor RNA into VGAM349 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM349 RNA is designated SEQ ID:684, and is provided hereinbelow with reference to the sequence listing part.

[10173] VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM349 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10174] VGAM349 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM349 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM349 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10175] The complementary binding of VGAM349 RNA, herein designated VGAM RNA, to host target binding sites on VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM349 host target RNA into VGAM349 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10176] It is appreciated that VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM349 host target genes. The mRNA of each one of this plurality of VGAM349 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM349 RNA, herein designated VGAM RNA, and which when bound by VGAM349 RNA causes inhibition of translation of respective one or more VGAM349 host target proteins.

[10177] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM349 gene, herein designated VGAM GENE, on one or more VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10178] It is yet further appreciated that a function of VGAM349 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM349 correlate with, and may be deduced from, the identity of the host target genes which VGAM349 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10179] Nucleotide sequences of the VGAM349 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM349 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM349 are further described hereinbelow with reference to Table 1.

[10180] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM349 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM349 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10181] As mentioned hereinabove with reference to Fig. 1, a function of VGAM349 gene, herein designated VGAM is inhibition of expression of VGAM349 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM349 correlate with, and may be deduced from, the identity of the target genes which VGAM349 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10182] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM349 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide

sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10183] A function of VGAM349 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is another VGAM349 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10184] Another function of VGAM349 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which

may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM349 host target gene.

PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10185] Another function of VGAM349 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly,

utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM349 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10186] Another function of VGAM349 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions as—

sociated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM39.DKFZP564I0422

(Accession NM_031435) is another VGAM349 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10187] Another function of VGAM349 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM349 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10188] Another function of VGAM349 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM349 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10189] Another function of VGAM349 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of

VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM349 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10190] Another function of VGAM349 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM349 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10191] Another function of VGAM349 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM349 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10192] Another function of VGAM349 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities

of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM349 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:684.

[10193] Another function of VGAM349 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 350 (VGAM350) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10194] VGAM350 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM350 was detected is described hereinabove with reference to Figs. 1–8.

[10195] VGAM350 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM350 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10196] VGAM350 gene encodes a VGAM350 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM350 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM350 precursor RNA is designated SEQ ID:336, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:336 is located at position 963 relative to the genome of Vaccinia Virus.

[10197] VGAM350 precursor RNA folds onto itself, forming VGAM350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10198] An enzyme complex designated DICER COMPLEX, `dices` the VGAM350 folded precursor RNA into VGAM350 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM350 RNA is designated SEQ ID:685, and is provided hereinbelow with reference to the sequence listing part.

[10199] VGAM350 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM350 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[10200] VGAM350 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM350 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM350 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10201] The complementary binding of VGAM350 RNA, herein designated VGAM RNA, to host target binding sites on VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM350 host target RNA into VGAM350 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10202] It is appreciated that VGAM350 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM350 host target genes. The mRNA of each one of this plurality of VGAM350 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM350 RNA, herein designated VGAM RNA, and which when bound by VGAM350 RNA causes inhibition of translation of respective one or more VGAM350 host target proteins.

[10203] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM350 gene, herein designated VGAM GENE, on one or more VGAM350 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10204] It is yet further appreciated that a function of VGAM350 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM350 correlate with, and may be deduced from, the identity of the host target genes which VGAM350 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10205] Nucleotide sequences of the VGAM350 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM350 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM350 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM350 are further
described hereinbelow with reference to Table 1.

[10206] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM350 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM350 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10207] As mentioned hereinabove with reference to Fig. 1, a function of VGAM350 gene, herein designated VGAM is inhibition of expression of VGAM350 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM350 correlate with, and may be deduced from, the identity of the target genes which VGAM350 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10208] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM350 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide

sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10209] A function of VGAM350 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.Keratocan (KERA, Accession NM_007035) is another VGAM350 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10210] Another function of VGAM350 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which

may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM350 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10211] Another function of VGAM350 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly,

utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM350 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10212] Another function of VGAM350 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions as—

sociated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM39.DKFZP564I0422

(Accession NM_031435) is another VGAM350 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10213] Another function of VGAM350 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM350 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10214] Another function of VGAM350 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM350 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10215] Another function of VGAM350 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of

VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM350 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10216] Another function of VGAM350 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM350 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10217] Another function of VGAM350 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM350 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10218] Another function of VGAM350 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities

of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM350 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:685.

[10219] Another function of VGAM350 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 351 (VGAM351) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10220] VGAM351 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM351 was detected is described hereinabove with reference to Figs. 1–8.

[10221] VGAM351 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM351 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10222] VGAM351 gene encodes a VGAM351 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM351 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM351 precursor RNA is designated SEQ ID:337, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:337 is located at position 963 relative to the genome of Vaccinia Virus.

[10223] VGAM351 precursor RNA folds onto itself, forming VGAM351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

‘hairpin structure’, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[10224] An enzyme complex designated DICER COMPLEX, ‘dices’ the VGAM351 folded precursor RNA into VGAM351 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, ‘dicing’ of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM351 RNA is designated SEQ ID:686, and is provided hereinbelow with reference to the sequence listing part.

[10225] VGAM351 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM351 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5’ untranslated region, a protein coding region and a 3’ untranslated region, designated 5’UTR, PROTEIN

CODING and 3`UTR respectively.

[10226] VGAM351 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM351 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM351 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10227] The complementary binding of VGAM351 RNA, herein designated VGAM RNA, to host target binding sites on VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM351 host target RNA into VGAM351 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10228] It is appreciated that VGAM351 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM351 host target genes. The mRNA of each one of this plurality of VGAM351 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM351 RNA, herein designated VGAM RNA, and which when bound by VGAM351 RNA causes inhibition of translation of respective one or more VGAM351 host target proteins.

[10229] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM351 gene, herein designated VGAM GENE, on one or more VGAM351 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10230] It is yet further appreciated that a function of VGAM351 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM351 correlate with, and may be deduced from, the identity of the host target genes which VGAM351 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10231] Nucleotide sequences of the VGAM351 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM351 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM351 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM351 are further
described hereinbelow with reference to Table 1.

[10232] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM351 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM351 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[10233] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM351 gene, herein designated VGAM is
inhibition of expression of VGAM351 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM351 correlate with, and may be deduced
from, the identity of the target genes which VGAM351
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[10234] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession
NM_012242) is a VGAM351 host target gene. DKK1 BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:686.

[10235] A function of VGAM351 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is another VGAM351 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:686.

[10236] Another function of VGAM351 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM351 host target gene.

PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM351 RNA,

herein designated VGAM RNA, also designated SEQ ID:686.

[10237] Another function of VGAM351 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM351 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:686.

[10238] Another function of VGAM351 is therefore inhibition of

S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.DKFZP564I0422

(Accession NM_031435) is another VGAM351 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:686.

[10239] Another function of VGAM351 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM351 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM351 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:686.

[10240] Another function of VGAM351 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM351 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:686.

[10241] Another function of VGAM351 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM351 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:686.

[10242] Another function of VGAM351 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig),

Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM351 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:686.

[10243] Another function of VGAM351 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM351 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:686.

[10244] Another function of VGAM351 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM351 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:686.

[10245] Another function of VGAM351 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 352 (VGAM352) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10246] VGAM352 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM352 was detected is described hereinabove with reference to Figs. 1–8.

[10247] VGAM352 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10248] VGAM352 gene encodes a VGAM352 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM352 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM352 precursor RNA is designated SEQ ID:338, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:338 is

located at position 2576 relative to the genome of Vaccinia Virus.

[10249] VGAM352 precursor RNA folds onto itself, forming VGAM352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10250] An enzyme complex designated DICER COMPLEX, `dices` the VGAM352 folded precursor RNA into VGAM352 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM352 RNA is designated SEQ ID:687, and is provided hereinbelow with reference to the sequence listing part.

[10251] VGAM352 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM352 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[10252] VGAM352 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM352 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM352 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM352 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10253] The complementary binding of VGAM352 RNA, herein designated VGAM RNA, to host target binding sites on VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM352 host target RNA into VGAM352 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10254] It is appreciated that VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM352 host target genes. The mRNA of each one of this plurality of VGAM352 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM352 RNA, herein designated VGAM RNA, and which when bound by VGAM352 RNA causes inhibition of translation of respective one or more VGAM352

host target proteins.

[10255] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM352 gene, herein designated VGAM GENE, on one or more VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10256] It is yet further appreciated that a function of VGAM352 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM352 correlate with, and may be deduced from, the identity of the host target genes which VGAM352 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10257] Nucleotide sequences of the VGAM352 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM352 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM352 are further described hereinbelow with reference to Table 1.

[10258] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM352 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM352 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10259] As mentioned hereinabove with reference to Fig. 1, a function of VGAM352 gene, herein designated VGAM is inhibition of expression of VGAM352 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM352 correlate with, and may be deduced from, the identity of the target genes which VGAM352 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10260] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM352 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:687.

[10261] A function of VGAM352 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM39.Keratocan (KERA, Accession NM_007035) is another VGAM352 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:687.

[10262] Another function of VGAM352 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM352 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:687.

[10263] Another function of VGAM352 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM352 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:687.

[10264] Another function of VGAM352 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.DKFZP564I0422 (Accession NM_031435) is another VGAM352 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422

BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:687.

[10265] Another function of VGAM352 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM352 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:687.

[10266] Another function of VGAM352 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657

(Accession NM_022483) is another VGAM352 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:687.

[10267] Another function of VGAM352 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM352 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:687.

[10268] Another function of VGAM352 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM352 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:687.

[10269] Another function of VGAM352 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507

(Accession XM_059440) is another VGAM352 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:687.

[10270] Another function of VGAM352 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM352 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM352 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:687.

[10271] Another function of VGAM352 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 353 (VGAM353) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10272] VGAM353 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM353 was detected is described hereinabove with reference to Figs. 1–8.

[10273] VGAM353 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10274] VGAM353 gene encodes a VGAM353 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM353 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM353 precursor RNA is designated SEQ ID:339, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:339 is located at position 4213 relative to the genome of Vaccinia Virus.

[10275] VGAM353 precursor RNA folds onto itself, forming VGAM353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10276] An enzyme complex designated DICER COMPLEX, `dices` the VGAM353 folded precursor RNA into VGAM353 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM353 RNA is designated SEQ ID:688, and is provided hereinbelow with reference to the sequence listing part.

[10277] VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM353 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10278] VGAM353 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM353 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM353 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10279] The complementary binding of VGAM353 RNA, herein designated VGAM RNA, to host target binding sites on VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM353 host target RNA into VGAM353 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10280] It is appreciated that VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM353 host target genes. The mRNA of

each one of this plurality of VGAM353 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM353 RNA, herein designated VGAM RNA, and which when bound by VGAM353 RNA causes inhibition of translation of respective one or more VGAM353 host target proteins.

[10281] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM353 gene, herein designated VGAM GENE, on one or more VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[10282] It is yet further appreciated that a function of VGAM353 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM353 correlate with, and may be deduced from, the identity of the host target genes which VGAM353 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[10283] Nucleotide sequences of the VGAM353 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM353 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM353 are further described hereinbelow with reference to Table 1.

[10284] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM353 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM353 RNA, herein desig—

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[10285] As mentioned hereinabove with reference to Fig. 1, a function of VGAM353 gene, herein designated VGAM is inhibition of expression of VGAM353 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM353 correlate with, and may be deduced from, the identity of the target genes which VGAM353 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10286] EFG1 (Accession XM_170611) is a VGAM353 host target gene. EFG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFG1 BINDING SITE, designated SEQ ID:3661, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:688.

[10287] A function of VGAM353 is therefore inhibition of EFG1 (Accession XM_170611), a gene which promotes the gtp-dependent translocation of the nascent protein chain from the a-site to the p-site of the ribosome in the mitochon-

dria. Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFG1. The function of EFG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46. Phytanoyl-CoA Hydroxylase (Refsum disease) (PHYH, Accession NM_006214) is another VGAM353 host target gene. PHYH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHYH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHYH BINDING SITE, designated SEQ ID:1281, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:688.

[10288] Another function of VGAM353 is therefore inhibition of Phytanoyl-CoA Hydroxylase (Refsum disease) (PHYH, Accession NM_006214). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHYH. Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3 (SLC6A3, Accession NM_001044) is another

VGAM353 host target gene. SLC6A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A3 BINDING SITE, designated SEQ ID:795, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:688.

[10289] Another function of VGAM353 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3 (SLC6A3, Accession NM_001044), a gene which terminates the action of dopamine by its high affinity sodium-dependent reuptake into presynaptic terminals. Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A3. The function of SLC6A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46.H2AV (Accession NM_138635) is another VGAM353 host target gene. H2AV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

H2AV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ ID:2447, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:688.

[10290] Another function of VGAM353 is therefore inhibition of H2AV (Accession NM_138635). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV. HMP19 (Accession XM_113455) is another VGAM353 host target gene. HMP19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMP19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMP19 BINDING SITE, designated SEQ ID:3408, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:688.

[10291] Another function of VGAM353 is therefore inhibition of HMP19 (Accession XM_113455). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HMP19. KIAA1726 (Accession XM_040860) is another VGAM353 host target gene. KIAA1726 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1726 BINDING SITE, designated SEQ ID:2786, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:688.

[10292] Another function of VGAM353 is therefore inhibition of KIAA1726 (Accession XM_040860). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1726. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 354 (VGAM354) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10293] VGAM354 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM354 was detected is described hereinabove with reference to Figs. 1–8.

[10294] VGAM354 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10295] VGAM354 gene encodes a VGAM354 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM354 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM354 precursor RNA is designated SEQ ID:340, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:340 is located at position 3249 relative to the genome of Vaccinia Virus.

[10296] VGAM354 precursor RNA folds onto itself, forming VGAM354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10297] An enzyme complex designated DICER COMPLEX, `dices` the VGAM354 folded precursor RNA into VGAM354 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM354 RNA is designated SEQ ID:689, and is provided hereinbelow with reference to the sequence listing part.

[10298] VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM354 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10299] VGAM354 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM354 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM354 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10300] The complementary binding of VGAM354 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM354 host target RNA into VGAM354 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10301] It is appreciated that VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM354 host target genes. The mRNA of each one of this plurality of VGAM354 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM354 RNA, herein designated VGAM RNA, and which when bound by VGAM354 RNA causes inhibition of translation of respective one or more VGAM354 host target proteins.

[10302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM354 gene, herein designated VGAM GENE, on one or more VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10303] It is yet further appreciated that a function of VGAM354 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM354 correlate with, and may be deduced from, the identity of the host target genes which VGAM354 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10304] Nucleotide sequences of the VGAM354 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM354 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM354 are further described hereinbelow with reference to Table 1.

[10305] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM354 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM354 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10306] As mentioned hereinabove with reference to Fig. 1, a function of VGAM354 gene, herein designated VGAM is inhibition of expression of VGAM354 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM354 correlate with, and may be deduced from, the identity of the target genes which VGAM354 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10307] SRY (sex determining region Y)-box 11 (SOX11, Accession NM_003108) is a VGAM354 host target gene. SOX11 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by SOX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX11 BINDING SITE, designated SEQ ID:992, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:689.

[10308] A function of VGAM354 is therefore inhibition of SRY (sex determining region Y)-box 11 (SOX11, Accession NM_003108). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX11. CAP350 (Accession NM_014810) is another VGAM354 host target gene. CAP350 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAP350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAP350 BINDING SITE, designated SEQ ID:1554, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:689.

[10309] Another function of VGAM354 is therefore inhibition of

CAP350 (Accession NM_014810). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAP350. DKFZP564A022 (Accession NM_030954) is another VGAM354 host target gene. DKFZP564A022 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564A022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564A022 BINDING SITE, designated SEQ ID:2174, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:689.

[10310] Another function of VGAM354 is therefore inhibition of DKFZP564A022 (Accession NM_030954). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564A022. FLJ11730 (Accession NM_022756) is another VGAM354 host target gene. FLJ11730 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ11730 BINDING SITE, designated SEQ ID:2005, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:689.

[10311] Another function of VGAM354 is therefore inhibition of FLJ11730 (Accession NM_022756). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11730. FLJ20686 (Accession NM_017925) is another VGAM354 host target gene. FLJ20686 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20686 BINDING SITE, designated SEQ ID:1765, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:689.

[10312] Another function of VGAM354 is therefore inhibition of FLJ20686 (Accession NM_017925). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20686. FRSB (Accession NM_005687) is another VGAM354 host

target gene. FRSB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FRSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRSB BINDING SITE, designated SEQ ID:1236, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:689.

[10313] Another function of VGAM354 is therefore inhibition of FRSB (Accession NM_005687). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRSB. KIAA1600 (Accession XM_049351) is another VGAM354 host target gene. KIAA1600 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:2919, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:689.

[10314] Another function of VGAM354 is therefore inhibition of

KIAA1600 (Accession XM_049351). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600. LOC124801 (Accession XM_058850) is another VGAM354 host target gene. LOC124801 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124801, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124801 BINDING SITE, designated SEQ ID:2996, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:689.

[10315] Another function of VGAM354 is therefore inhibition of LOC124801 (Accession XM_058850). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124801. LOC221035 (Accession XM_167640) is another VGAM354 host target gene. LOC221035 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC221035 BINDING SITE, designated SEQ ID:3593, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:689.

[10316] Another function of VGAM354 is therefore inhibition of LOC221035 (Accession XM_167640). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221035. LOC51611 (Accession NM_015958) is another VGAM354 host target gene. LOC51611 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51611 BINDING SITE, designated SEQ ID:1653, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:689.

[10317] Another function of VGAM354 is therefore inhibition of LOC51611 (Accession NM_015958). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51611. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 355 (VGAM355) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10318] VGAM355 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM355 was detected is described hereinabove with reference to Figs. 1–8.

[10319] VGAM355 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10320] VGAM355 gene encodes a VGAM355 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM355 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM355 precursor RNA is designated SEQ ID:341, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:341 is

located at position 3686 relative to the genome of Vaccinia Virus.

[10321] VGAM355 precursor RNA folds onto itself, forming VGAM355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10322] An enzyme complex designated DICER COMPLEX, `dices` the VGAM355 folded precursor RNA into VGAM355 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM355 RNA is designated SEQ ID:690, and is provided hereinbelow with reference to the sequence listing part.

[10323] VGAM355 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM355 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[10324] VGAM355 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM355 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM355 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM355 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[10325] The complementary binding of VGAM355 RNA, herein designated VGAM RNA, to host target binding sites on VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM355 host target RNA into VGAM355 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10326] It is appreciated that VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM355 host target genes. The mRNA of each one of this plurality of VGAM355 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM355 RNA, herein designated VGAM RNA, and which when bound by VGAM355 RNA causes inhibition of translation of respective one or more VGAM355

host target proteins.

[10327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM355 gene, herein designated VGAM GENE, on one or more VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10328] It is yet further appreciated that a function of VGAM355 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM355 correlate with, and may be deduced from, the identity of the host target genes which VGAM355 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10329] Nucleotide sequences of the VGAM355 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM355 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM355 are further described hereinbelow with reference to Table 1.

[10330] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM355 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM355 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10331] As mentioned hereinabove with reference to Fig. 1, a function of VGAM355 gene, herein designated VGAM is inhibition of expression of VGAM355 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM355 correlate with, and may be deduced from, the identity of the target genes which VGAM355 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10332] AXIN1 Up-regulated 1 (AXUD1, Accession NM_033027) is a VGAM355 host target gene. AXUD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AXUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXUD1 BINDING SITE, designated SEQ ID:2309, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10333] A function of VGAM355 is therefore inhibition of AXIN1 Up-regulated 1 (AXUD1, Accession NM_033027). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXUD1. Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458) is another VGAM355 host target gene. BSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BSN, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSN BINDING SITE, designated SEQ ID:1024, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10334] Another function of VGAM355 is therefore inhibition of Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458), a gene which may be involved in cytomatrix organization at the site of neurotransmitter release. Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSN. The function of BSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM48. Dihydropyrimidinase-like 2 (DPYSL2, Accession NM_001386) is another VGAM355 host target gene. DPYSL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPYSL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL2 BINDING SITE, des-

ignated SEQ ID:822, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10335] Another function of VGAM355 is therefore inhibition of Dihydropyrimidinase-like 2 (DPYSL2, Accession NM_001386), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL2. The function of DPYSL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM48. Epithelial V-like Antigen 1 (EVA1, Accession NM_005797) is another VGAM355 host target gene. EVA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVA1 BINDING SITE, designated SEQ ID:1250, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10336] Another function of VGAM355 is therefore inhibition of

Epithelial V-like Antigen 1 (EVA1, Accession NM_005797). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVA1. Parathymosin (PTMS, Accession NM_002824) is another VGAM355 host target gene. PTMS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTMS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTMS BINDING SITE, designated SEQ ID:959, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10337] Another function of VGAM355 is therefore inhibition of Parathymosin (PTMS, Accession NM_002824), a gene which is involved in the regulation of cellular immunity. Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTMS. The function of PTMS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM48. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is an-

other VGAM355 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:748, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10338] Another function of VGAM355 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983) is another VGAM355 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:1076, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10339] Another function of VGAM355 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM48. Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242) is another VGAM355 host target gene. TGFB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TGFB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TGFBR2 BINDING SITE, designated SEQ ID:1003, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10340] Another function of VGAM355 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFBR2, Accession NM_003242). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR2. DKFZP586N0721 (Accession NM_015400) is another VGAM355 host target gene. DKFZP586N0721 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP586N0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586N0721 BINDING SITE, designated SEQ ID:1627, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10341] Another function of VGAM355 is therefore inhibition of DKFZP586N0721 (Accession NM_015400). Accordingly,

utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586N0721. DKFZp761J139 (Accession NM_032280) is another VGAM355 host target gene. DKFZp761J139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761J139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761J139 BINDING SITE, designated SEQ ID:2242, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10342] Another function of VGAM355 is therefore inhibition of DKFZp761J139 (Accession NM_032280). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761J139. FLJ10468 (Accession NM_018101) is another VGAM355 host target gene. FLJ10468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ10468 BINDING SITE, designated SEQ ID:1779, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10343] Another function of VGAM355 is therefore inhibition of FLJ10468 (Accession NM_018101). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10468. FLJ20485 (Accession NM_019042) is another VGAM355 host target gene. FLJ20485 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20485 BINDING SITE, designated SEQ ID:1874, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10344] Another function of VGAM355 is therefore inhibition of FLJ20485 (Accession NM_019042). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20485. H2B Histone Family, Member Q (H2BFQ, Accession

XM_001940) is another VGAM355 host target gene.

H2BFQ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H2BFQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2BFQ BINDING SITE, designated SEQ ID:2523, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10345] Another function of VGAM355 is therefore inhibition of H2B Histone Family, Member Q (H2BFQ, Accession XM_001940). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2BFQ. KIAA0077 (Accession XM_040158) is another VGAM355 host target gene. KIAA0077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0077 BINDING SITE, designated SEQ ID:2774, to the nucleotide sequence of VGAM355

RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10346] Another function of VGAM355 is therefore inhibition of KIAA0077 (Accession XM_040158). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0077. KIAA0295 (Accession XM_042833) is another VGAM355 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:2807, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10347] Another function of VGAM355 is therefore inhibition of KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. KIAA0828 (Accession XM_088105) is another VGAM355 host target gene. KIAA0828 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:3195, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10348] Another function of VGAM355 is therefore inhibition of KIAA0828 (Accession XM_088105). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828. KIAA1203 (Accession XM_049683) is another VGAM355 host target gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:2921, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10349] Another function of VGAM355 is therefore inhibition of KIAA1203 (Accession XM_049683). Accordingly, utilities

of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1203. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is another VGAM355 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:1928, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10350] Another function of VGAM355 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8.

p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168) is another VGAM355 host target gene. PAK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK6, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK6 BINDING SITE, designated SEQ ID:1897, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10351] Another function of VGAM355 is therefore inhibition of p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6. Polymerase (RNA) III (DNA directed) Polypeptide F, 39 KDa (POLR3F, Accession XM_009639) is another VGAM355 host target gene. POLR3F BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLR3F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLR3F BINDING SITE, designated SEQ ID:2547, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10352] Another function of VGAM355 is therefore inhibition of Polymerase (RNA) III (DNA directed) Polypeptide F, 39 KDa

(POLR3F, Accession XM_009639). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLR3F. Ring Finger Protein 11 (RNF11, Accession NM_014372) is another VGAM355 host target gene. RNF11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF11 BINDING SITE, designated SEQ ID:1495, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10353] Another function of VGAM355 is therefore inhibition of Ring Finger Protein 11 (RNF11, Accession NM_014372). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF11. Solute Carrier Family 16 (monocarboxylic acid transporters), Member 6 (SLC16A6, Accession NM_004694) is another VGAM355 host target gene. SLC16A6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC16A6, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A6 BINDING SITE, designated SEQ ID:1143, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10354] Another function of VGAM355 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 6 (SLC16A6, Accession NM_004694). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A6. LOC144321 (Accession XM_096578) is another VGAM355 host target gene. LOC144321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144321 BINDING SITE, designated SEQ ID:3267, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10355] Another function of VGAM355 is therefore inhibition of

LOC144321 (Accession XM_096578). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144321. LOC150951 (Accession XM_097975) is another VGAM355 host target gene. LOC150951 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150951 BINDING SITE, designated SEQ ID:3336, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10356] Another function of VGAM355 is therefore inhibition of LOC150951 (Accession XM_097975). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150951. LOC199920 (Accession XM_114056) is another VGAM355 host target gene. LOC199920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC199920 BINDING SITE, designated SEQ ID:3435, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10357] Another function of VGAM355 is therefore inhibition of LOC199920 (Accession XM_114056). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199920. LOC256435 (Accession XM_170925) is another VGAM355 host target gene. LOC256435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256435 BINDING SITE, designated SEQ ID:3675, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:690.

[10358] Another function of VGAM355 is therefore inhibition of LOC256435 (Accession XM_170925). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256435. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 356 (VGAM356) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10359] VGAM356 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM356 was detected is described hereinabove with reference to Figs. 1–8.

[10360] VGAM356 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10361] VGAM356 gene encodes a VGAM356 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM356 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM356 precursor RNA is designated SEQ ID:342, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:342 is

located at position 3573 relative to the genome of Vaccinia Virus.

[10362] VGAM356 precursor RNA folds onto itself, forming VGAM356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10363] An enzyme complex designated DICER COMPLEX, `dices` the VGAM356 folded precursor RNA into VGAM356 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM356 RNA is designated SEQ ID:691, and is provided hereinbelow with reference to the sequence listing part.

[10364] VGAM356 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM356 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[10365] VGAM356 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM356 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM356 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM356 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[10366] The complementary binding of VGAM356 RNA, herein designated VGAM RNA, to host target binding sites on VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM356 host target RNA into VGAM356 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10367] It is appreciated that VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM356 host target genes. The mRNA of each one of this plurality of VGAM356 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM356 RNA, herein designated VGAM RNA, and which when bound by VGAM356 RNA causes inhibition of translation of respective one or more VGAM356

host target proteins.

[10368] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM356 gene, herein designated VGAM GENE, on one or more VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10369] It is yet further appreciated that a function of VGAM356 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM356 correlate with, and may be deduced from, the identity of the host target genes which VGAM356 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10370] Nucleotide sequences of the VGAM356 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM356 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM356 are further described hereinbelow with reference to Table 1.

[10371] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM356 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM356 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10372] As mentioned hereinabove with reference to Fig. 1, a function of VGAM356 gene, herein designated VGAM is inhibition of expression of VGAM356 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM356 correlate with, and may be deduced from, the identity of the target genes which VGAM356 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10373] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038) is a VGAM356 host target gene. ADAMTS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS5 BINDING SITE, designated SEQ ID:1352, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10374] A function of VGAM356 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ADAMTS5. The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Adenosine Deaminase, TRNA-specific 1 (ADAT1, Accession NM_012091) is another VGAM356 host target gene. ADAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAT1 BINDING SITE, designated SEQ ID:1404, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10375] Another function of VGAM356 is therefore inhibition of Adenosine Deaminase, TRNA-specific 1 (ADAT1, Accession NM_012091), a gene which TRNA-specific adenosine deaminase; deaminates A(37) in the anticodon loop of tRNA(Ala). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAT1. The function of ADAT1 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Adenylate Cyclase 2 (brain) (ADCY2, Accession XM_036383) is another VGAM356 host target gene. ADCY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY2 BINDING SITE, designated SEQ ID:2711, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10376] Another function of VGAM356 is therefore inhibition of Adenylate Cyclase 2 (brain) (ADCY2, Accession XM_036383), a gene which Adenylate cyclase (type 2), an ATP-pyrophosphate lyase; converts ATP to cAMP. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY2. The function of ADCY2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Aryl Hydrocarbon Receptor (AHR, Accession NM_001621) is another VGAM356

host target gene. AHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:840, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10377] Another function of VGAM356 is therefore inhibition of Aryl Hydrocarbon Receptor (AHR, Accession NM_001621), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic-metabolizing enzymes. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHR. The function of AHR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458) is another VGAM356 host target gene. BSN BINDING SITE1 and BSN BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA en-

coded by BSN, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSN BINDING SITE1 and BSN BINDING SITE2, designated SEQ ID:1025 and SEQ ID:1026 respectively, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10378] Another function of VGAM356 is therefore inhibition of Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458), a gene which may be involved in cytomatrix organization at the site of neurotransmitter release. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSN. The function of BSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM48. Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM_000492) is another VGAM356 host target gene. CFTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CFTR, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CFTR BINDING SITE, designated SEQ ID:753, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10379] Another function of VGAM356 is therefore inhibition of Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM_000492). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CFTR. Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM_001271) is another VGAM356 host target gene. CHD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHD2 BINDING SITE, designated SEQ ID:813, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10380] Another function of VGAM356 is therefore inhibition of

Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM_001271). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHD2. Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082) is another VGAM356 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:703, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10381] Another function of VGAM356 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKN1. Cystathionase (cystathionine gamma-lyase) (CTH, Accession NM_001902) is another VGAM356 host target gene. CTH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CTH, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTH BINDING SITE, designated SEQ ID:867, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10382] Another function of VGAM356 is therefore inhibition of Cystathionase (cystathionine gamma-lyase) (CTH, Accession NM_001902), a gene which catalyzes removal of ammonia, cleaves cystathionine to yield free cys. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTH. The function of CTH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Epithelial V-like Antigen 1 (EVA1, Accession NM_005797) is another VGAM356 host target gene. EVA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVA1 BINDING SITE, designated SEQ

ID:1251, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10383] Another function of VGAM356 is therefore inhibition of Epithelial V-like Antigen 1 (EVA1, Accession NM_005797). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVA1. F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM_012308) is another VGAM356 host target gene. FBXL11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL11 BINDING SITE, designated SEQ ID:1426, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10384] Another function of VGAM356 is therefore inhibition of F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM_012308), a gene which are BTB/POZ domain-containing zinc finger proteins implicated in oncogenesis. Accordingly, utilities of VGAM356 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with FBXL11. The function of FBXL11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. GATA Binding Protein 3 (GATA3, Accession NM_002051) is another VGAM356 host target gene. GATA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GATA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATA3 BINDING SITE, designated SEQ ID:893, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10385] Another function of VGAM356 is therefore inhibition of GATA Binding Protein 3 (GATA3, Accession NM_002051). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA3. GDP Dissociation Inhibitor 2 (GDI2, Accession NM_001494) is another VGAM356 host target gene. GDI2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded

by GDI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDI2 BINDING SITE, designated SEQ ID:832, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10386] Another function of VGAM356 is therefore inhibition of GDP Dissociation Inhibitor 2 (GDI2, Accession NM_001494), a gene which regulates the gdp/gtp exchange reaction of most rab proteins by inhibiting the dissociation of gdp from them, and the subsequent binding of gtp to them. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDI2. The function of GDI2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Huntingtin (Huntington disease) (HD, Accession NM_002111) is another VGAM356 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:899, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10387] Another function of VGAM356 is therefore inhibition of Huntingtin (Huntington disease) (HD, Accession NM_002111). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868) is another VGAM356 host target gene. HTR2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTR2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR2C BINDING SITE, designated SEQ ID:781, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10388] Another function of VGAM356 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868), a gene which activates phospholipase C and regulates intracellular calcium flux. Accord-

ingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR2C. The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. LGR6 (Accession XM_097508) is another VGAM356 host target gene. LGR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LGR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGR6 BINDING SITE, designated SEQ ID:3302, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10389] Another function of VGAM356 is therefore inhibition of LGR6 (Accession XM_097508). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGR6. Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM_033300) is another VGAM356 host target gene. LRP8 BINDING SITE1 and LRP8 BINDING SITE2 are HOST TARGET binding

sites found in untranslated regions of mRNA encoded by LRP8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP8 BINDING SITE1 and LRP8 BINDING SITE2, designated SEQ ID:2326 and SEQ ID:1139 respectively, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10390] Another function of VGAM356 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM_033300), a gene which binds vldl and transports it into cells by endocytosis. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP8. The function of LRP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Macrophage Scavenger Receptor 1 (MSR1, Accession NM_002445) is another VGAM356 host target gene. MSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSR1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSR1 BINDING SITE, designated SEQ ID:929, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10391] Another function of VGAM356 is therefore inhibition of Macrophage Scavenger Receptor 1 (MSR1, Accession NM_002445), a gene which plays a role in endocytosis of macromolecules. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSR1. The function of MSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Protocadherin 11 X-linked (PCDH11X, Accession NM_032968) is another VGAM356 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ

ID:2299 and SEQ ID:2301 respectively, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10392] Another function of VGAM356 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Protein-L-isoaspartate (D-aspartate) O-methyltransferase (PCMT1, Accession NM_005389) is another VGAM356 host target gene. PCMT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCMT1 BINDING SITE, designated SEQ ID:1205, to the nucleotide se-

quence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10393] Another function of VGAM356 is therefore inhibition of Protein-L-isoaspartate (D-aspartate) O-methyltransferase (PCMT1, Accession NM_005389), a gene which catalyzes the methyl esterification of l-isoaspartyl and d-aspartyl residues in peptides and proteins . Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCMT1. The function of PCMT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Proliferating Cell Nuclear Antigen (PCNA, Accession NM_002592) is another VGAM356 host target gene. PCNA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCNA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCNA BINDING SITE, designated SEQ ID:939, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10394] Another function of VGAM356 is therefore inhibition of

Proliferating Cell Nuclear Antigen (PCNA, Accession NM_002592), a gene which is involved in the control of eukaryotic dna replication by increasing the polymerase's processibility during elongation of the leading strand. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCNA. The function of PCNA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Proline Arginine-rich End Leucine-rich Repeat Protein (PRELP, Accession NM_002725) is another VGAM356 host target gene. PRELP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRELP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRELP BINDING SITE, designated SEQ ID:950, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10395] Another function of VGAM356 is therefore inhibition of Proline Arginine-rich End Leucine-rich Repeat Protein (PRELP, Accession NM_002725), a gene which is a connec-

tive tissue glycoprotein of the leucine-rich-repeat (LRR) family. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRELP. The function of PRELP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Parathymosin (PTMS, Accession NM_002824) is another VGAM356 host target gene. PTMS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTMS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTMS BINDING SITE, designated SEQ ID:958, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10396] Another function of VGAM356 is therefore inhibition of Parathymosin (PTMS, Accession NM_002824), a gene which is involved in the regulation of cellular immunity. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTMS. The function of PTMS and its asso-

ciation with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM48. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM_003759) is another VGAM356 host target gene. SLC4A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:1054, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10397] Another function of VGAM356 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM_003759), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A4. The function of SLC4A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein

inabove with reference to VGAM49.Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM356 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:1471, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10398] Another function of VGAM356 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49.ARS2 (Accession NM_015908) is another VGAM356 host target gene. ARS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by ARS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARS2 BINDING SITE, designated SEQ ID:1650, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10399] Another function of VGAM356 is therefore inhibition of ARS2 (Accession NM_015908). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARS2. Bromodomain Containing 4 (BRD4, Accession NM_058243) is another VGAM356 host target gene. BRD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD4 BINDING SITE, designated SEQ ID:2368, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10400] Another function of VGAM356 is therefore inhibition of Bromodomain Containing 4 (BRD4, Accession

NM_058243). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD4. CAPN13 (Accession NM_144575) is another VGAM356 host target gene.

CAPN13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN13 BINDING SITE, designated SEQ ID:2485, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10401] Another function of VGAM356 is therefore inhibition of CAPN13 (Accession NM_144575). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN13. Cat Eye Syndrome Chromosome Region, Candidate 6 (CECR6, Accession NM_031890) is another VGAM356 host target gene. CECR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CECR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CECR6 BINDING SITE, designated SEQ ID:2218, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10402] Another function of VGAM356 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 6 (CECR6, Accession NM_031890). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR6. DKFZP434I0714 (Accession XM_098247) is another VGAM356 host target gene. DKFZP434I0714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434I0714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I0714 BINDING SITE, designated SEQ ID:3362, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10403] Another function of VGAM356 is therefore inhibition of DKFZP434I0714 (Accession XM_098247). Accordingly, utilities of VGAM356 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434I0714. DKFZP564G092 (Accession NM_015601) is another VGAM356 host target gene. DKFZP564G092 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP564G092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564G092 BINDING SITE, designated SEQ ID:1639, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10404] Another function of VGAM356 is therefore inhibition of DKFZP564G092 (Accession NM_015601). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564G092. DKFZp564K142 (Accession NM_032121) is another VGAM356 host target gene. DKFZp564K142 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp564K142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZp564K142 BINDING SITE, designated SEQ ID:2231, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10405] Another function of VGAM356 is therefore inhibition of DKFZp564K142 (Accession NM_032121). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp564K142. DKFZp566D234 (Accession XM_030162) is another VGAM356 host target gene. DKFZp566D234 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp566D234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D234 BINDING SITE, designated SEQ ID:2612, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10406] Another function of VGAM356 is therefore inhibition of DKFZp566D234 (Accession XM_030162). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp566D234. DKFZP566I1024 (Accession XM_046506) is another VGAM356 host target gene. DKFZP566I1024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566I1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566I1024 BINDING SITE, designated SEQ ID:2878, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10407] Another function of VGAM356 is therefore inhibition of DKFZP566I1024 (Accession XM_046506). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566I1024. EPI64 (Accession XM_170997) is another VGAM356 host target gene. EPI64 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPI64, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPI64 BINDING SITE, designated SEQ ID:3681, to the nucleotide se-

quence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10408] Another function of VGAM356 is therefore inhibition of EPI64 (Accession XM_170997). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPI64. FLJ00012 (Accession XM_058426) is another VGAM356 host target gene. FLJ00012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00012 BINDING SITE, designated SEQ ID:2985, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10409] Another function of VGAM356 is therefore inhibition of FLJ00012 (Accession XM_058426). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00012. FLJ10460 (Accession NM_018097) is another VGAM356 host target gene. FLJ10460 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ10460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10460 BINDING SITE, designated SEQ ID:1778, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10410] Another function of VGAM356 is therefore inhibition of FLJ10460 (Accession NM_018097). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10460. FLJ10687 (Accession NM_018178) is another VGAM356 host target gene. FLJ10687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10687 BINDING SITE, designated SEQ ID:1793, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10411] Another function of VGAM356 is therefore inhibition of FLJ10687 (Accession NM_018178). Accordingly, utilities of

VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10687. FLJ10738 (Accession NM_018199) is another VGAM356 host target gene. FLJ10738 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10738 BINDING SITE, designated SEQ ID:1799, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10412] Another function of VGAM356 is therefore inhibition of FLJ10738 (Accession NM_018199). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10738. FLJ13158 (Accession NM_024909) is another VGAM356 host target gene. FLJ13158 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13158 BINDING SITE,

designated SEQ ID:2109, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10413] Another function of VGAM356 is therefore inhibition of FLJ13158 (Accession NM_024909). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13158. FLJ20294 (Accession NM_017749) is another VGAM356 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:1747, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10414] Another function of VGAM356 is therefore inhibition of FLJ20294 (Accession NM_017749). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. FLJ21657 (Accession NM_022483) is another VGAM356 host target gene. FLJ21657 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1991, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10415] Another function of VGAM356 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. GT650 (Accession NM_052851) is another VGAM356 host target gene. GT650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GT650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GT650 BINDING SITE, designated SEQ ID:2341, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10416] Another function of VGAM356 is therefore inhibition of

GT650 (Accession NM_052851). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GT650. Hairy/enhancer-of-split Related with YRPW Motif 2 (HEY2, Accession NM_012259) is another VGAM356 host target gene. HEY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEY2 BINDING SITE, designated SEQ ID:1420, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10417] Another function of VGAM356 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif 2 (HEY2, Accession NM_012259). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEY2. Hypermethylated In Cancer 2 (HIC2, Accession XM_036937) is another VGAM356 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:2717, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10418] Another function of VGAM356 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM_036937). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. HOOK3 (Accession NM_032410) is another VGAM356 host target gene. HOOK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOOK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOOK3 BINDING SITE, designated SEQ ID:2249, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10419] Another function of VGAM356 is therefore inhibition of HOOK3 (Accession NM_032410). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HOOK3. Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271) is another VGAM356 host target gene. IL1RAPL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IL1RAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAPL1 BINDING SITE, designated SEQ ID:1488, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10420] Another function of VGAM356 is therefore inhibition of Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RAPL1. KALI (Accession NM_052931) is another VGAM356 host target gene. KALI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KALI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of KALI BINDING SITE, designated SEQ ID:2347, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10421] Another function of VGAM356 is therefore inhibition of KALI (Accession NM_052931). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KALI. KIAA0077 (Accession XM_040158) is another VGAM356 host target gene. KIAA0077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0077 BINDING SITE, designated SEQ ID:2773, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10422] Another function of VGAM356 is therefore inhibition of KIAA0077 (Accession XM_040158). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0077. KIAA0089 (Accession XM_046056) is another VGAM356 host target gene. KIAA0089 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:2873, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10423] Another function of VGAM356 is therefore inhibition of KIAA0089 (Accession XM_046056). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0089. KIAA0286 (Accession XM_043118) is another VGAM356 host target gene. KIAA0286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0286 BINDING SITE, designated SEQ ID:2814, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10424] Another function of VGAM356 is therefore inhibition of

KIAA0286 (Accession XM_043118). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0286. KIAA0295 (Accession XM_042833) is another VGAM356 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:2808, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10425] Another function of VGAM356 is therefore inhibition of KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. KIAA0342 (Accession XM_047357) is another VGAM356 host target gene. KIAA0342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0342 BINDING SITE, designated SEQ ID:2890, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10426] Another function of VGAM356 is therefore inhibition of KIAA0342 (Accession XM_047357). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0342. KIAA0564 (Accession XM_038664) is another VGAM356 host target gene. KIAA0564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0564 BINDING SITE, designated SEQ ID:2743, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10427] Another function of VGAM356 is therefore inhibition of KIAA0564 (Accession XM_038664). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0564. KIAA0630 (Accession XM_114729) is another

VGAM356 host target gene. KIAA0630 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:3465, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10428] Another function of VGAM356 is therefore inhibition of KIAA0630 (Accession XM_114729). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630. KIAA0662 (Accession XM_088539) is another VGAM356 host target gene. KIAA0662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0662 BINDING SITE, designated SEQ ID:3215, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10429] Another function of VGAM356 is therefore inhibition of KIAA0662 (Accession XM_088539). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0662. KIAA0830 (Accession XM_045759) is another VGAM356 host target gene. KIAA0830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0830 BINDING SITE, designated SEQ ID:2866, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10430] Another function of VGAM356 is therefore inhibition of KIAA0830 (Accession XM_045759). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0830. KIAA0964 (Accession NM_014902) is another VGAM356 host target gene. KIAA0964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0964, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0964 BINDING SITE, designated SEQ ID:1579, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10431] Another function of VGAM356 is therefore inhibition of KIAA0964 (Accession NM_014902). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0964. KIAA1076 (Accession XM_037523) is another VGAM356 host target gene. KIAA1076 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1076 BINDING SITE, designated SEQ ID:2723, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10432] Another function of VGAM356 is therefore inhibition of KIAA1076 (Accession XM_037523). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1076. KIAA1181 (Accession XM_043340) is another VGAM356 host target gene. KIAA1181 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1181 BINDING SITE, designated SEQ ID:2817, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10433] Another function of VGAM356 is therefore inhibition of KIAA1181 (Accession XM_043340). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1181. KIAA1319 (Accession NM_020770) is another VGAM356 host target gene. KIAA1319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1319 BINDING SITE, designated SEQ ID:1925, to the nucleotide sequence of VGAM356 RNA, herein designated

VGAM RNA, also designated SEQ ID:691.

[10434] Another function of VGAM356 is therefore inhibition of KIAA1319 (Accession NM_020770). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1319. KIAA1522 (Accession XM_036299) is another VGAM356 host target gene. KIAA1522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1522 BINDING SITE, designated SEQ ID:2708, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10435] Another function of VGAM356 is therefore inhibition of KIAA1522 (Accession XM_036299). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1522. KIAA1906 (Accession XM_055095) is another VGAM356 host target gene. KIAA1906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1906, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1906 BINDING SITE, designated SEQ ID:2971, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10436] Another function of VGAM356 is therefore inhibition of KIAA1906 (Accession XM_055095). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1906. Mitogen-activated Protein Kinase 6 (MAPK6, Accession NM_002748) is another VGAM356 host target gene. MAPK6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAPK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK6 BINDING SITE, designated SEQ ID:952, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10437] Another function of VGAM356 is therefore inhibition of Mitogen-activated Protein Kinase 6 (MAPK6, Accession

NM_002748). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK6. MGC13138 (Accession NM_033410) is another VGAM356 host target gene. MGC13138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13138 BINDING SITE, designated SEQ ID:2332, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10438] Another function of VGAM356 is therefore inhibition of MGC13138 (Accession NM_033410). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13138. MGC2742 (Accession NM_023938) is another VGAM356 host target gene. MGC2742 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC2742 BINDING SITE, designated SEQ ID:2040, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10439] Another function of VGAM356 is therefore inhibition of MGC2742 (Accession NM_023938). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2742. MGC32043 (Accession NM_144582) is another VGAM356 host target gene. MGC32043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC32043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32043 BINDING SITE, designated SEQ ID:2486, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10440] Another function of VGAM356 is therefore inhibition of MGC32043 (Accession NM_144582). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32043. Nuclear Factor of Activated T-cells 5, Tonic-

ity-responsive (NFAT5, Accession NM_138714) is another VGAM356 host target gene. NFAT5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NFAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:2452, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10441] Another function of VGAM356 is therefore inhibition of Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is another VGAM356 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ

ID:1929, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10442] Another function of VGAM356 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. RAB10, Member RAS Oncogene Family (RAB10, Accession XM_097979) is another VGAM356 host target gene. RAB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB10 BINDING SITE, designated SEQ ID:3337, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10443] Another function of VGAM356 is therefore inhibition of RAB10, Member RAS Oncogene Family (RAB10, Accession XM_097979). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB10. RAN Binding Protein

1 (RANBP1, Accession NM_002882) is another VGAM356 host target gene. RANBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RANBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP1 BINDING SITE, designated SEQ ID:969, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10444] Another function of VGAM356 is therefore inhibition of RAN Binding Protein 1 (RANBP1, Accession NM_002882). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP1. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM356 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:1537, to the nucleotide se-

quence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10445] Another function of VGAM356 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. Serine/threonine Kinase 22D (spermiogenesis associated) (STK22D, Accession NM_032028) is another VGAM356 host target gene. STK22D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK22D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK22D BINDING SITE, designated SEQ ID:2226, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10446] Another function of VGAM356 is therefore inhibition of Serine/threonine Kinase 22D (spermiogenesis associated) (STK22D, Accession NM_032028). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK22D.

Synaptojanin 2 (SYNJ2, Accession XM_029746) is another VGAM356 host target gene. SYNJ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNJ2 BINDING SITE, designated SEQ ID:2606, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10447] Another function of VGAM356 is therefore inhibition of Synaptojanin 2 (SYNJ2, Accession XM_029746). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNJ2. TBLR1 (Accession NM_024665) is another VGAM356 host target gene. TBLR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBLR1 BINDING SITE, designated SEQ ID:2079, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:691.

[10448] Another function of VGAM356 is therefore inhibition of TBLR1 (Accession NM_024665). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBLR1. Transmembrane 9 Superfamily Member 1 (TM9SF1, Accession NM_006405) is another VGAM356 host target gene. TM9SF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TM9SF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM9SF1 BINDING SITE, designated SEQ ID:1296, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10449] Another function of VGAM356 is therefore inhibition of Transmembrane 9 Superfamily Member 1 (TM9SF1, Accession NM_006405). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM9SF1. Unc-51-like Kinase 2 (C. elegans) (ULK2, Accession NM_014683) is another VGAM356 host target gene. ULK2

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ULK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ULK2 BINDING SITE, designated SEQ ID:1523, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10450] Another function of VGAM356 is therefore inhibition of Unc-51-like Kinase 2 (*C. elegans*) (ULK2, Accession NM_014683). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ULK2. Unc-5 Homolog D (*C. elegans*) (UNC5D, Accession NM_080872) is another VGAM356 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UNC5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5D BINDING SITE, designated SEQ ID:2393, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10451] Another function of VGAM356 is therefore inhibition of Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. LOC121219 (Accession XM_058544) is another VGAM356 host target gene. LOC121219 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC121219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121219 BINDING SITE, designated SEQ ID:2988, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10452] Another function of VGAM356 is therefore inhibition of LOC121219 (Accession XM_058544). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121219. LOC128077 (Accession XM_059208) is another VGAM356 host target gene. LOC128077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128077, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128077 BINDING SITE, designated SEQ ID:3006, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10453] Another function of VGAM356 is therefore inhibition of LOC128077 (Accession XM_059208). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128077. LOC143451 (Accession XM_084521) is another VGAM356 host target gene. LOC143451 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143451 BINDING SITE, designated SEQ ID:3058, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10454] Another function of VGAM356 is therefore inhibition of LOC143451 (Accession XM_084521). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC143451. LOC145125 (Accession XM_085025) is another VGAM356 host target gene. LOC145125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145125 BINDING SITE, designated SEQ ID:3075, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10455] Another function of VGAM356 is therefore inhibition of LOC145125 (Accession XM_085025). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145125. LOC149351 (Accession XM_086503) is another VGAM356 host target gene. LOC149351 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149351 BINDING SITE, designated SEQ ID:3131, to

the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10456] Another function of VGAM356 is therefore inhibition of LOC149351 (Accession XM_086503). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149351. LOC149722 (Accession XM_097709) is another VGAM356 host target gene. LOC149722 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149722 BINDING SITE, designated SEQ ID:3312, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10457] Another function of VGAM356 is therefore inhibition of LOC149722 (Accession XM_097709). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149722. LOC149837 (Accession XM_097747) is another VGAM356 host target gene. LOC149837 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC149837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:3318, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10458] Another function of VGAM356 is therefore inhibition of LOC149837 (Accession XM_097747). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837. LOC150054 (Accession XM_097797) is another VGAM356 host target gene. LOC150054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150054 BINDING SITE, designated SEQ ID:3323, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10459] Another function of VGAM356 is therefore inhibition of LOC150054 (Accession XM_097797). Accordingly, utilities

of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150054. LOC150150 (Accession XM_097820) is another VGAM356 host target gene. LOC150150 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150150 BINDING SITE, designated SEQ ID:3324, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10460] Another function of VGAM356 is therefore inhibition of LOC150150 (Accession XM_097820). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150150. LOC150225 (Accession XM_097870) is another VGAM356 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150225 BINDING SITE, designated SEQ ID:3327, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10461] Another function of VGAM356 is therefore inhibition of LOC150225 (Accession XM_097870). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC152816 (Accession XM_098270) is another VGAM356 host target gene. LOC152816 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152816 BINDING SITE, designated SEQ ID:3364, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10462] Another function of VGAM356 is therefore inhibition of LOC152816 (Accession XM_098270). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152816. LOC155038 (Accession XM_088130) is another VGAM356 host target gene. LOC155038 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155038 BINDING SITE, designated SEQ ID:3198, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10463] Another function of VGAM356 is therefore inhibition of LOC155038 (Accession XM_088130). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155038. LOC158629 (Accession XM_098972) is another VGAM356 host target gene. LOC158629 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158629, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158629 BINDING SITE, designated SEQ ID:3394, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10464] Another function of VGAM356 is therefore inhibition of

LOC158629 (Accession XM_098972). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158629. LOC158943 (Accession XM_018400) is another VGAM356 host target gene. LOC158943 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158943 BINDING SITE, designated SEQ ID:2572, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10465] Another function of VGAM356 is therefore inhibition of LOC158943 (Accession XM_018400). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158943. LOC170082 (Accession XM_093092) is another VGAM356 host target gene. LOC170082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC170082 BINDING SITE, designated SEQ ID:3254, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10466] Another function of VGAM356 is therefore inhibition of LOC170082 (Accession XM_093092). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170082. LOC199920 (Accession XM_114056) is another VGAM356 host target gene. LOC199920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199920 BINDING SITE, designated SEQ ID:3436, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10467] Another function of VGAM356 is therefore inhibition of LOC199920 (Accession XM_114056). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199920. LOC219667 (Accession XM_166098) is an-

other VGAM356 host target gene. LOC219667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219667 BINDING SITE, designated SEQ ID:3516, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10468] Another function of VGAM356 is therefore inhibition of LOC219667 (Accession XM_166098). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219667. LOC220279 (Accession XM_169083) is another VGAM356 host target gene. LOC220279 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220279 BINDING SITE, designated SEQ ID:3653, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10469] Another function of VGAM356 is therefore inhibition of LOC220279 (Accession XM_169083). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220279. LOC221830 (Accession XM_166508) is another VGAM356 host target gene. LOC221830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221830 BINDING SITE, designated SEQ ID:3567, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10470] Another function of VGAM356 is therefore inhibition of LOC221830 (Accession XM_166508). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221830. LOC222166 (Accession XM_168425) is another VGAM356 host target gene. LOC222166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:3635, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10471] Another function of VGAM356 is therefore inhibition of LOC222166 (Accession XM_168425). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. LOC254440 (Accession XM_173126) is another VGAM356 host target gene. LOC254440 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254440, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254440 BINDING SITE, designated SEQ ID:3729, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10472] Another function of VGAM356 is therefore inhibition of LOC254440 (Accession XM_173126). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254440. LOC51123 (Accession XM_018277) is another VGAM356 host target gene. LOC51123 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51123 BINDING SITE, designated SEQ ID:2571, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10473] Another function of VGAM356 is therefore inhibition of LOC51123 (Accession XM_018277). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51123. LOC51596 (Accession NM_015921) is another VGAM356 host target gene. LOC51596 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51596 BINDING SITE, designated SEQ ID:1651, to the nucleotide sequence of VGAM356 RNA, herein designated

VGAM RNA, also designated SEQ ID:691.

[10474] Another function of VGAM356 is therefore inhibition of LOC51596 (Accession NM_015921). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51596. LOC84570 (Accession NM_032518) is another VGAM356 host target gene. LOC84570 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC84570, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84570 BINDING SITE, designated SEQ ID:2257, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10475] Another function of VGAM356 is therefore inhibition of LOC84570 (Accession NM_032518). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84570. LOC92710 (Accession XM_046811) is another VGAM356 host target gene. LOC92710 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92710, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92710 BINDING SITE, designated SEQ ID:2885, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:691.

[10476] Another function of VGAM356 is therefore inhibition of LOC92710 (Accession XM_046811). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92710. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 357 (VGAM357) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10477] VGAM357 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM357 was detected is described hereinabove with reference to Figs. 1–8.

[10478] VGAM357 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10479] VGAM357 gene encodes a VGAM357 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM357 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM357 precursor RNA is designated SEQ ID:343, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:343 is located at position 2870 relative to the genome of Vaccinia Virus.

[10480] VGAM357 precursor RNA folds onto itself, forming VGAM357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10481] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM357 folded precursor RNA into VGAM357 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM357 RNA is designated SEQ ID:692, and is provided hereinbelow with reference to the sequence listing part.

[10482] VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM357 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10483] VGAM357 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM357 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM357 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10484] The complementary binding of VGAM357 RNA, herein designated VGAM RNA, to host target binding sites on VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM357 host target RNA into VGAM357 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10485] It is appreciated that VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM357 host target genes. The mRNA of each one of this plurality of VGAM357 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM357 RNA, herein designated VGAM RNA, and which when bound by VGAM357 RNA causes inhibition of translation of respective one or more VGAM357 host target proteins.

[10486] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM357 gene, herein designated VGAM GENE, on one or more VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10487] It is yet further appreciated that a function of VGAM357 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM357 correlate with, and may be deduced from, the identity of the host target genes which VGAM357 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10488] Nucleotide sequences of the VGAM357 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM357 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM357 are further described hereinbelow with reference to Table 1.

[10489] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM357 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM357 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10490] As mentioned hereinabove with reference to Fig. 1, a function of VGAM357 gene, herein designated VGAM is inhibition of expression of VGAM357 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM357 correlate with, and may be deduced from, the identity of the target genes which VGAM357 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10491] Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725) is a VGAM357 host target gene. FANCF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:1997,

to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10492] A function of VGAM357 is therefore inhibition of Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF. G Protein-coupled Receptor 65 (GPR65, Accession XM_007392) is another VGAM357 host target gene. GPR65 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPR65, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR65 BINDING SITE, designated SEQ ID:2544, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10493] Another function of VGAM357 is therefore inhibition of G Protein-coupled Receptor 65 (GPR65, Accession XM_007392). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR65. Lamin B1 (LMNB1, Accession NM_005573) is another VGAM357 host target

gene. LMNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LMNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMNB1 BINDING SITE, designated SEQ ID:1226, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10494] Another function of VGAM357 is therefore inhibition of Lamin B1 (LMNB1, Accession NM_005573), a gene which is thought to provide a framework for the nuclear envelope and may also interact with chromatin. Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMNB1. The function of LMNB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM50. Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804) is another VGAM357 host target gene. MEN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE, designated SEQ ID:3600, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10495] Another function of VGAM357 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655) is another VGAM357 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:944, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10496] Another function of VGAM357 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession

NM_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM50. S100 Calcium Binding Protein A11 (calgizzarin) (S100A11, Accession NM_005620) is another VGAM357 host target gene. S100A11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100A11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100A11 BINDING SITE, designated SEQ ID:1231, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10497] Another function of VGAM357 is therefore inhibition of S100 Calcium Binding Protein A11 (calgizzarin) (S100A11, Accession NM_005620), a gene which is a tissue/cell type specific calcium-binding protein that interacts with target proteins to link extracellular stimuli to cellular responses;

member of the S100 family. Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100A11. The function of S100A11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM50. Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM_006359) is another VGAM357 host target gene. SLC9A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC9A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A6 BINDING SITE, designated SEQ ID:1290, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10498] Another function of VGAM357 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM_006359), a gene which is involved electroneutral exchange of protons for Na^+ and K^+ across the mitochondrial inner membrane. Accordingly, utilities of VGAM357 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with SLC9A6. The function of SLC9A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM50. Superoxide Dismutase 2, Mitochondrial (SOD2, Accession NM_000636) is another VGAM357 host target gene. SOD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOD2 BINDING SITE, designated SEQ ID:766, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10499] Another function of VGAM357 is therefore inhibition of Superoxide Dismutase 2, Mitochondrial (SOD2, Accession NM_000636), a gene which is intramitochondrial free radical scavenging enzyme. When he has polymorphism in signal peptides he could cause diseases of distribution. Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOD2. The function of SOD2 and its asso-

ciation with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM50. Baculoviral IAP Repeat-containing 2 (BIRC2, Accession XM_040717) is another VGAM357 host target gene. BIRC2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BIRC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC2 BINDING SITE, designated SEQ ID:2784, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10500] Another function of VGAM357 is therefore inhibition of Baculoviral IAP Repeat-containing 2 (BIRC2, Accession XM_040717). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC2. Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709) is another VGAM357 host target gene. CXorf1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CXorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf1 BINDING SITE, designated SEQ ID:1145, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10501] Another function of VGAM357 is therefore inhibition of Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf1. KIAA0367 (Accession XM_041018) is another VGAM357 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:2787, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10502] Another function of VGAM357 is therefore inhibition of KIAA0367 (Accession XM_041018). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0367. KIAA1321 (Accession XM_030856) is another VGAM357 host target gene. KIAA1321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1321 BINDING SITE, designated SEQ ID:2627, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10503] Another function of VGAM357 is therefore inhibition of KIAA1321 (Accession XM_030856). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1321. KIAA1718 (Accession XM_034823) is another VGAM357 host target gene. KIAA1718 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1718 BINDING SITE, designated SEQ ID:2686, to the

nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10504] Another function of VGAM357 is therefore inhibition of KIAA1718 (Accession XM_034823). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1718. KIAA1789 (Accession XM_040486) is another VGAM357 host target gene. KIAA1789 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:2781, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10505] Another function of VGAM357 is therefore inhibition of KIAA1789 (Accession XM_040486). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1789. PRO2964 (Accession NM_018547) is another VGAM357 host target gene. PRO2964 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by PRO2964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2964 BINDING SITE, designated SEQ ID:1842, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10506] Another function of VGAM357 is therefore inhibition of PRO2964 (Accession NM_018547). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2964. Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM_020346) is another VGAM357 host target gene. SLC17A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A6 BINDING SITE, designated SEQ ID:1912, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10507] Another function of VGAM357 is therefore inhibition of Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM_020346). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A6. TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256) is another VGAM357 host target gene. TRAF3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRAF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF3 BINDING SITE, designated SEQ ID:2542, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10508] Another function of VGAM357 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. LOC151361 (Accession XM_098048) is another VGAM357 host target gene. LOC151361 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by LOC151361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151361 BINDING SITE, designated SEQ ID:3344, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10509] Another function of VGAM357 is therefore inhibition of LOC151361 (Accession XM_098048). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151361. LOC158714 (Accession XM_088650) is another VGAM357 host target gene. LOC158714 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158714 BINDING SITE, designated SEQ ID:3224, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10510] Another function of VGAM357 is therefore inhibition of

LOC158714 (Accession XM_088650). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158714. LOC219667 (Accession XM_166098) is another VGAM357 host target gene. LOC219667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219667 BINDING SITE, designated SEQ ID:3518, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10511] Another function of VGAM357 is therefore inhibition of LOC219667 (Accession XM_166098). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219667. LOC91565 (Accession XM_039231) is another VGAM357 host target gene. LOC91565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC91565 BINDING SITE, designated SEQ ID:2749, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:692.

[10512] Another function of VGAM357 is therefore inhibition of LOC91565 (Accession XM_039231). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91565. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 358 (VGAM358) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10513] VGAM358 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM358 was detected is described hereinabove with reference to Figs. 1–8.

[10514] VGAM358 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[10515] VGAM358 gene encodes a VGAM358 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM358 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM358 precursor RNA is designated SEQ ID:344, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:344 is located at position 151547 relative to the genome of Vaccinia Virus.

[10516] VGAM358 precursor RNA folds onto itself, forming VGAM358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10517] An enzyme complex designated DICER COMPLEX, `dices` the VGAM358 folded precursor RNA into VGAM358 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM358 RNA is designated SEQ ID:693, and is provided hereinbelow with reference to the sequence listing part.

[10518] VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM358 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10519] VGAM358 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM358 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM358 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10520] The complementary binding of VGAM358 RNA, herein designated VGAM RNA, to host target binding sites on VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM358 host target RNA into VGAM358 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10521] It is appreciated that VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM358 host target genes. The mRNA of each one of this plurality of VGAM358 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM358 RNA, herein designated VGAM RNA, and which when bound by VGAM358 RNA causes inhibition of translation of respective one or more VGAM358 host target proteins.

[10522] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM358 gene, herein designated VGAM GENE, on one or more VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10523] It is yet further appreciated that a function of VGAM358 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM358 correlate with, and may be deduced from, the identity of the host target genes which VGAM358 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10524] Nucleotide sequences of the VGAM358 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM358 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM358 are further described hereinbelow with reference to Table 1.

[10525] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM358 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM358 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10526] As mentioned hereinabove with reference to Fig. 1, a function of VGAM358 gene, herein designated VGAM is inhibition of expression of VGAM358 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM358 correlate with, and may be deduced from, the identity of the target genes which VGAM358 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10527] Ets Homologous Factor (EHF, Accession NM_012153) is a VGAM358 host target gene. EHF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EHF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHF BINDING SITE, designated SEQ ID:1411, to the nucleotide sequence of VGAM358 RNA, herein designated VGAM RNA, also designated SEQ ID:693.

[10528] A function of VGAM358 is therefore inhibition of Ets Homologous Factor (EHF, Accession NM_012153), a gene which is Member of the ESE subfamily of Ets transcription factors. Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHF. The function of EHF has been established by previous studies. By searching an EST database, Kas et al. (2000) identified an EST with sequence similarity to the ETS domain of human ESE1 (ELF3; 602191). They obtained a full-length cDNA encoding EHF, which they called ESE3, by using 5-prime RACE on human prostate cDNA. RT-PCR analysis identified 2 alternatively spliced forms of ESE3, ESE3a and ESE3b. Sequence analysis predicted that ESE3a encodes a 277-amino acid protein with a molecular mass of 32.3 kD, while ESE3b encodes a 300-amino acid protein with a molecular mass of 34.9 kD. The C-terminal ETS domain of ESE3 is 84% and 65% identical to the ETS domains of ESE1 and ESE2 (ELF5; 605169), respectively. Northern blot analysis detected a 5.9-kb ESE3 transcript in pancreas and prostate, with lower levels detected in kidney and colon. Dot blot analysis detected high levels of ESE3 expression in salivary gland, prostate, and trachea, with lower levels detected in

colon, mammary gland, pancreas, lung, stomach, appendix, fetal kidney, and fetal lung. Using RT-PCR on primary and tumor-derived cell lines, the authors detected expression of ESE3 in tumor cells of epithelial origin. Gel-shift experiments showed binding of ESE3 to 3 high-affinity binding sites in the MET (OMIM Ref. No. 164860) promoter. Cotransfection of ESE3 expression vectors with a MET promoter-luciferase reporter construct demonstrated that both ESE3a and ESE3b act as transcriptional activators on this promoter. Kleinbaum et al. (1999) mapped the EHF gene to 11p12 by somatic cell hybrid analysis and FISH.

[10529] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10530] Kas, K.; Finger, E.; Grall, F.; Gu, X.; Akbarali, Y.; Boltax, J.; Weiss, A.; Oettgen, P.; Kapeller, R.; Libermann, T. A. : ESE-3, a novel member of an epithelium-specific Ets transcription factor subfamily, demonstrates different target gene specificity from ESE-1. J. Biol. Chem. 275: 2986-2998, 2000. ; and

[10531] Kleinbaum, L. A.; Duggan, C.; Ferreira, E.; Coffey, G. P.; Buttice, G.; Burton, F. H. : Human chromosomal localiza-

tion, tissue/tumor expression, and regulatory function of the ets fami.

[10532] Further studies establishing the function and utilities of EHF are found in John Hopkins OMIM database record ID 605439, and in cited publications numbered 1071–1072 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM_032012) is another VGAM358 host target gene. C9orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf5 BINDING SITE, designated SEQ ID:2225, to the nucleotide sequence of VGAM358 RNA, herein designated VGAM RNA, also designated SEQ ID:693.

[10533] Another function of VGAM358 is therefore inhibition of Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM_032012). Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf5. KIAA1546 (Accession XM_042301) is another VGAM358 host target

gene. KIAA1546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1546 BINDING SITE, designated SEQ ID:2805, to the nucleotide sequence of VGAM358 RNA, herein designated VGAM RNA, also designated SEQ ID:693.

[10534] Another function of VGAM358 is therefore inhibition of KIAA1546 (Accession XM_042301). Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1546. LOC253263 (Accession XM_173102) is another VGAM358 host target gene. LOC253263 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253263 BINDING SITE, designated SEQ ID:3724, to the nucleotide sequence of VGAM358 RNA, herein designated VGAM RNA, also designated SEQ ID:693.

[10535] Another function of VGAM358 is therefore inhibition of LOC253263 (Accession XM_173102). Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253263. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 359 (VGAM359) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10536] VGAM359 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM359 was detected is described hereinabove with reference to Figs. 1–8.

[10537] VGAM359 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10538] VGAM359 gene encodes a VGAM359 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM359

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM359 precursor RNA is designated SEQ ID:345, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:345 is located at position 151270 relative to the genome of Vaccinia Virus.

[10539] VGAM359 precursor RNA folds onto itself, forming VGAM359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10540] An enzyme complex designated DICER COMPLEX, `dices` the VGAM359 folded precursor RNA into VGAM359 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 84%) nucleotide sequence of VGAM359 RNA is designated SEQ ID:694, and is provided hereinbelow with reference to the sequence listing part.

[10541] VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM359 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[10542] VGAM359 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM359 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM359 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10543] The complementary binding of VGAM359 RNA, herein designated VGAM RNA, to host target binding sites on VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM359 host target RNA into VGAM359 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10544] It is appreciated that VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM359 host target genes. The mRNA of each one of this plurality of VGAM359 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM359 RNA, herein designated VGAM RNA, and which when bound by VGAM359 RNA causes inhibition of translation of respective one or more VGAM359 host target proteins.

[10545] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM359 gene, herein designated VGAM GENE, on one or more VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10546] It is yet further appreciated that a function of VGAM359 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM359 correlate with, and may be deduced from, the identity of the host target genes which VGAM359 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10547] Nucleotide sequences of the VGAM359 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM359 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM359 are further described hereinbelow with reference to Table 1.

[10548] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM359 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM359 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[10549] As mentioned hereinabove with reference to Fig. 1, a function of VGAM359 gene, herein designated VGAM is inhibition of expression of VGAM359 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM359 correlate with, and may be deduced from, the identity of the target genes which VGAM359 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10550] Breast Cancer 1, Early Onset (BRCA1, Accession NM_007294) is a VGAM359 host target gene. BRCA1 BINDING SITE1 through BRCA1 BINDING SITE11 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BRCA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRCA1 BINDING SITE1 through BRCA1 BINDING SITE11, designated SEQ ID:1380, SEQ ID:1381, SEQ ID:1382, SEQ ID:1383, SEQ ID:1384, SEQ ID:1385, SEQ ID:1386, SEQ ID:1387, SEQ ID:1388, SEQ ID:1389 and SEQ ID:1391 respectively, to the nucleotide sequence of VGAM359 RNA, herein designated VGAM RNA, also designated SEQ ID:694.

[10551] A function of VGAM359 is therefore inhibition of Breast Cancer 1, Early Onset (BRCA1, Accession NM_007294). Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA1. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM359 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:1470, to the nucleotide sequence of VGAM359 RNA, herein designated VGAM RNA, also designated SEQ ID:694.

[10552] Another function of VGAM359 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM49.FLJ23323 (Accession NM_024654) is another VGAM359 host target gene. FLJ23323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23323 BINDING SITE, designated SEQ ID:2077, to the nucleotide sequence of VGAM359 RNA, herein designated VGAM RNA, also designated SEQ ID:694.

[10553] Another function of VGAM359 is therefore inhibition of FLJ23323 (Accession NM_024654). Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23323. KIAA0057 (Accession NM_012288) is another VGAM359 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:1421, to the nucleotide sequence of

VGAM359 RNA, herein designated VGAM RNA, also designated SEQ ID:694.

[10554] Another function of VGAM359 is therefore inhibition of KIAA0057 (Accession NM_012288). Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. LOC145439 (Accession XM_085144) is another VGAM359 host target gene. LOC145439 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145439, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145439 BINDING SITE, designated SEQ ID:3079, to the nucleotide sequence of VGAM359 RNA, herein designated VGAM RNA, also designated SEQ ID:694.

[10555] Another function of VGAM359 is therefore inhibition of LOC145439 (Accession XM_085144). Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145439. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 360 (VGAM360) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10556] VGAM360 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM360 was detected is described hereinabove with reference to Figs. 1–8.

[10557] VGAM360 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10558] VGAM360 gene encodes a VGAM360 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM360 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM360 precursor RNA is designated SEQ ID:346, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:346 is located at position 180452 relative to the genome of Vaccinia Virus.

[10559] VGAM360 precursor RNA folds onto itself, forming VGAM360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10560] An enzyme complex designated DICER COMPLEX, `dices` the VGAM360 folded precursor RNA into VGAM360 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM360 RNA is designated SEQ ID:695, and is provided hereinbelow with reference to the sequence listing part.

[10561] VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM360 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM360 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10562] VGAM360 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM360 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM360 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10563] The complementary binding of VGAM360 RNA, herein designated VGAM RNA, to host target binding sites on VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM360 host target RNA into VGAM360 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10564] It is appreciated that VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM360 host target genes. The mRNA of each one of this plurality of VGAM360 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM360 RNA, herein designated VGAM RNA, and which when bound by VGAM360 RNA causes inhibition of translation of respective one or more VGAM360 host target proteins.

[10565] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM360 gene, herein designated VGAM GENE, on one or more VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10566] It is yet further appreciated that a function of VGAM360 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM360 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM360 correlate with, and may be deduced from, the identity of the host

target genes which VGAM360 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10567] Nucleotide sequences of the VGAM360 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM360 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM360 are further described hereinbelow with reference to Table 1.

[10568] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM360 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM360 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10569] As mentioned hereinabove with reference to Fig. 1, a function of VGAM360 gene, herein designated VGAM is inhibition of expression of VGAM360 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM360 correlate with, and may be deduced from, the identity of the target genes which VGAM360

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10570] DKFZP434G1411 (Accession XM_166383) is a VGAM360 host target gene. DKFZP434G1411 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434G1411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434G1411 BINDING SITE, designated SEQ ID:3554, to the nucleotide sequence of VGAM360 RNA, herein designated VGAM RNA, also designated SEQ ID:695.

[10571] A function of VGAM360 is therefore inhibition of DKFZP434G1411 (Accession XM_166383). Accordingly, utilities of VGAM360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434G1411. DKFZP564I052 (Accession XM_039660) is another VGAM360 host target gene. DKFZP564I052 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of DKFZP564I052 BINDING SITE, designated SEQ ID:2760, to the nucleotide sequence of VGAM360 RNA, herein designated VGAM RNA, also designated SEQ ID:695.

[10572] Another function of VGAM360 is therefore inhibition of DKFZP564I052 (Accession XM_039660). Accordingly, utilities of VGAM360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I052. Kelch-like 8 (Drosophila) (KLHL8, Accession XM_031735) is another VGAM360 host target gene. KLHL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL8 BINDING SITE, designated SEQ ID:2639, to the nucleotide sequence of VGAM360 RNA, herein designated VGAM RNA, also designated SEQ ID:695.

[10573] Another function of VGAM360 is therefore inhibition of Kelch-like 8 (Drosophila) (KLHL8, Accession XM_031735). Accordingly, utilities of VGAM360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL8. Extracellular Link Domain Con-

taining 1 (XLKD1, Accession NM_006691) is another VGAM360 host target gene. XLKD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XLKD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XLKD1 BINDING SITE, designated SEQ ID:1323, to the nucleotide sequence of VGAM360 RNA, herein designated VGAM RNA, also designated SEQ ID:695.

[10574] Another function of VGAM360 is therefore inhibition of Extracellular Link Domain Containing 1 (XLKD1, Accession NM_006691). Accordingly, utilities of VGAM360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XLKD1. LOC51003 (Accession NM_016060) is another VGAM360 host target gene. LOC51003 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51003, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51003 BINDING SITE, designated SEQ ID:1658, to the nucleotide sequence of

VGAM360 RNA, herein designated VGAM RNA, also designated SEQ ID:695.

[10575] Another function of VGAM360 is therefore inhibition of LOC51003 (Accession NM_016060). Accordingly, utilities of VGAM360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51003. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 361 (VGAM361) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10576] VGAM361 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM361 was detected is described hereinabove with reference to Figs. 1–8.

[10577] VGAM361 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10578] VGAM361 gene encodes a VGAM361 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM361 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM361 precursor RNA is designated SEQ ID:347, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:347 is located at position 183817 relative to the genome of Vaccinia Virus.

[10579] VGAM361 precursor RNA folds onto itself, forming VGAM361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10580] An enzyme complex designated DICER COMPLEX, `dices` the VGAM361 folded precursor RNA into VGAM361 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM361 RNA is designated SEQ ID:696, and is provided hereinbelow with reference to the sequence listing part.

[10581] VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM361 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[10582] VGAM361 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM361 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM361 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10583] The complementary binding of VGAM361 RNA, herein designated VGAM RNA, to host target binding sites on VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM361 host target RNA into VGAM361 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10584] It is appreciated that VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM361 host target genes. The mRNA of each one of this plurality of VGAM361 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM361 RNA, herein designated VGAM RNA, and which when bound by VGAM361 RNA causes inhibition of translation of respective one or more VGAM361 host target proteins.

[10585] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM361 gene, herein designated VGAM GENE, on one or more VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[10586] It is yet further appreciated that a function of VGAM361 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM361 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM361 correlate with, and may be deduced from, the identity of the host target genes which VGAM361 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[10587] Nucleotide sequences of the VGAM361 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM361 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM361 are further described hereinbelow with reference to Table 1.

[10588] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM361 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM361 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10589] As mentioned hereinabove with reference to Fig. 1, a function of VGAM361 gene, herein designated VGAM is inhibition of expression of VGAM361 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM361 correlate with, and may be deduced from, the identity of the target genes which VGAM361 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10590] Glucosaminyl (N-acetyl) Transferase 2, I-branching Enzyme (GCNT2, Accession NM_001491) is a VGAM361 host target gene. GCNT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GCNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCNT2 BINDING SITE, designated SEQ ID:831, to the nucleotide sequence of VGAM361 RNA, herein designated VGAM RNA, also designated SEQ ID:696.

[10591] A function of VGAM361 is therefore inhibition of Glu-

cosaminyl (N-acetyl) Transferase 2, I-branching Enzyme (GCNT2, Accession NM_001491), a gene which converts linear into branched poly-n-acetyllactosaminoglycans. Accordingly, utilities of VGAM361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCNT2. The function of GCNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM56.BLP1 (Accession NM_031940) is another VGAM361 host target gene. BLP1 BINDING SITE1 and BLP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BLP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLP1 BINDING SITE1 and BLP1 BINDING SITE2, designated SEQ ID:2222 and SEQ ID:2371 respectively, to the nucleotide sequence of VGAM361 RNA, herein designated VGAM RNA, also designated SEQ ID:696.

[10592] Another function of VGAM361 is therefore inhibition of BLP1 (Accession NM_031940). Accordingly, utilities of VGAM361 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with BLP1.

LOC253891 (Accession XM_170485) is another VGAM361 host target gene. LOC253891 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253891 BINDING SITE, designated SEQ ID:3654, to the nucleotide sequence of VGAM361 RNA, herein designated VGAM RNA, also designated SEQ ID:696.

[10593] Another function of VGAM361 is therefore inhibition of LOC253891 (Accession XM_170485). Accordingly, utilities of VGAM361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253891. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 362 (VGAM362) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10594] VGAM362 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM362 was detected is described hereinabove with reference to Figs. 1–8.

[10595] VGAM362 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10596] VGAM362 gene encodes a VGAM362 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM362 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM362 precursor RNA is designated SEQ ID:348, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:348 is located at position 183735 relative to the genome of Vaccinia Virus.

[10597] VGAM362 precursor RNA folds onto itself, forming VGAM362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10598] An enzyme complex designated DICER COMPLEX, `dices` the VGAM362 folded precursor RNA into VGAM362 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM362 RNA is designated SEQ ID:697, and is provided hereinbelow with reference to the sequence listing part.

[10599] VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM362 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10600] VGAM362 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM362 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM362 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10601] The complementary binding of VGAM362 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM362 host target RNA into VGAM362 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10602] It is appreciated that VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM362 host target genes. The mRNA of each one of this plurality of VGAM362 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM362 RNA, herein designated VGAM RNA, and which when bound by VGAM362 RNA causes inhibition of translation of respective one or more VGAM362 host target proteins.

[10603] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM362 gene, herein designated VGAM GENE, on one or more VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10604] It is yet further appreciated that a function of VGAM362 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM362 correlate with, and may be deduced from, the identity of the host target genes which VGAM362 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10605] Nucleotide sequences of the VGAM362 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM362 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM362 are further described hereinbelow with reference to Table 1.

[10606] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM362 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM362 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10607] As mentioned hereinabove with reference to Fig. 1, a function of VGAM362 gene, herein designated VGAM is inhibition of expression of VGAM362 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM362 correlate with, and may be deduced from, the identity of the target genes which VGAM362 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10608] Adenylosuccinate Synthase (ADSS, Accession XM_049992) is a VGAM362 host target gene. ADSS BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by ADSS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADSS BINDING SITE, designated SEQ ID:2925, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10609] A function of VGAM362 is therefore inhibition of Adenylosuccinate Synthase (ADSS, Accession XM_049992), a gene which plays an important role in the de novo pathway of purine nucleotide biosynthesis. Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADSS. The function of ADSS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Caspase 6, Apoptosis-related Cysteine Protease (CASP6, Accession NM_032992) is another VGAM362 host target gene. CASP6 BINDING SITE1 and CASP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of CASP6 BINDING SITE1 and CASP6 BINDING SITE2, designated SEQ ID:2305 and SEQ ID:810 respectively, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10610] Another function of VGAM362 is therefore inhibition of Caspase 6, Apoptosis-related Cysteine Protease (CASP6, Accession NM_032992), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP6. The function of CASP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Coagulation Factor II (thrombin) Receptor (F2R, Accession NM_001992) is another VGAM362 host target gene. F2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2R BINDING SITE, designated SEQ ID:879, to

the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10611] Another function of VGAM362 is therefore inhibition of Coagulation Factor II (thrombin) Receptor (F2R, Accession NM_001992), a gene which Thrombin receptor; G protein-coupled receptor involved in platelet activation. Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2R. The function of F2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. G Protein-coupled Receptor Kinase 7 (GPRK7, Accession NM_139209) is another VGAM362 host target gene. GPRK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPRK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRK7 BINDING SITE, designated SEQ ID:2476, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10612] Another function of VGAM362 is therefore inhibition of G

Protein-coupled Receptor Kinase 7 (GPRK7, Accession NM_139209), a gene which may play a role in signal transduction pathways that involve calcium as a second messenger. Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK7. The function of GPRK7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Neuroigin 1 (NLGN1, Accession NM_014932) is another VGAM362 host target gene. NLGN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NLGN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLGN1 BINDING SITE, designated SEQ ID:1591, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10613] Another function of VGAM362 is therefore inhibition of Neuroigin 1 (NLGN1, Accession NM_014932), a gene which may trigger the de novo formation of presynaptic structure. Accordingly, utilities of VGAM362 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with NLGN1. The function of NLGN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. APC10 (Accession NM_014885) is another VGAM362 host target gene. APC10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by APC10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APC10 BINDING SITE, designated SEQ ID:1574, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10614] Another function of VGAM362 is therefore inhibition of APC10 (Accession NM_014885). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APC10. Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749) is another VGAM362 host target gene. C20orf139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by C20orf139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf139 BINDING SITE, designated SEQ ID:3319, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10615] Another function of VGAM362 is therefore inhibition of Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf139.

FLJ11186 (Accession NM_018353) is another VGAM362 host target gene. FLJ11186 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11186 BINDING SITE, designated SEQ ID:1818, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10616] Another function of VGAM362 is therefore inhibition of

FLJ11186 (Accession NM_018353). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11186. FLJ22116 (Accession NM_024624) is another VGAM362 host target gene. FLJ22116 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22116 BINDING SITE, designated SEQ ID:2073, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10617] Another function of VGAM362 is therefore inhibition of FLJ22116 (Accession NM_024624). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22116. FLJ32978 (Accession NM_144625) is another VGAM362 host target gene. FLJ32978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ32978 BINDING SITE, designated SEQ ID:2487, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10618] Another function of VGAM362 is therefore inhibition of FLJ32978 (Accession NM_144625). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32978. KIAA1164 (Accession XM_045358) is another VGAM362 host target gene. KIAA1164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1164 BINDING SITE, designated SEQ ID:2862, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10619] Another function of VGAM362 is therefore inhibition of KIAA1164 (Accession XM_045358). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1164. KIAA1762 (Accession XM_033370) is another

VGAM362 host target gene. KIAA1762 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1762 BINDING SITE, designated SEQ ID:2668, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10620] Another function of VGAM362 is therefore inhibition of KIAA1762 (Accession XM_033370). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1762. KIAA1918 (Accession XM_054951) is another VGAM362 host target gene. KIAA1918 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1918 BINDING SITE, designated SEQ ID:2969, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10621] Another function of VGAM362 is therefore inhibition of KIAA1918 (Accession XM_054951). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1918. POPX1 (Accession NM_014906) is another VGAM362 host target gene. POPX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:1583, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10622] Another function of VGAM362 is therefore inhibition of POPX1 (Accession NM_014906). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POPX1. PRO0800 (Accession NM_018592) is another VGAM362 host target gene. PRO0800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0800 BINDING SITE, designated SEQ ID:1852, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10623] Another function of VGAM362 is therefore inhibition of PRO0800 (Accession NM_018592). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0800. LOC142779 (Accession XM_084337) is another VGAM362 host target gene. LOC142779 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC142779, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142779 BINDING SITE, designated SEQ ID:3050, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10624] Another function of VGAM362 is therefore inhibition of LOC142779 (Accession XM_084337). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC142779. LOC143274 (Accession XM_084477) is another VGAM362 host target gene. LOC143274 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143274 BINDING SITE, designated SEQ ID:3053, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10625] Another function of VGAM362 is therefore inhibition of LOC143274 (Accession XM_084477). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143274. LOC154089 (Accession XM_087846) is another VGAM362 host target gene. LOC154089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154089 BINDING SITE, designated SEQ ID:3186, to the nucleotide sequence of VGAM362 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:697.

[10626] Another function of VGAM362 is therefore inhibition of LOC154089 (Accession XM_087846). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154089. LOC169679 (Accession XM_108982) is another VGAM362 host target gene. LOC169679 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169679 BINDING SITE, designated SEQ ID:3404, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10627] Another function of VGAM362 is therefore inhibition of LOC169679 (Accession XM_108982). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169679. LOC202052 (Accession XM_117355) is another VGAM362 host target gene. LOC202052 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202052, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202052 BINDING SITE, designated SEQ ID:3484, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10628] Another function of VGAM362 is therefore inhibition of LOC202052 (Accession XM_117355). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202052. LOC256021 (Accession XM_172884) is another VGAM362 host target gene. LOC256021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256021 BINDING SITE, designated SEQ ID:3708, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10629] Another function of VGAM362 is therefore inhibition of LOC256021 (Accession XM_172884). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC256021. LOC91650 (Accession XM_039853) is another VGAM362 host target gene. LOC91650 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91650 BINDING SITE, designated SEQ ID:2765, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10630] Another function of VGAM362 is therefore inhibition of LOC91650 (Accession XM_039853). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91650. LOC91752 (Accession XM_040403) is another VGAM362 host target gene. LOC91752 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91752 BINDING SITE, designated SEQ ID:2777, to the

nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:697.

[10631] Another function of VGAM362 is therefore inhibition of LOC91752 (Accession XM_040403). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91752. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 363 (VGAM363) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10632] VGAM363 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM363 was detected is described hereinabove with reference to Figs. 1–8.

[10633] VGAM363 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10634] VGAM363 gene encodes a VGAM363 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM363 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM363 precursor RNA is designated SEQ ID:349, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:349 is located at position 185510 relative to the genome of Vaccinia Virus.

[10635] VGAM363 precursor RNA folds onto itself, forming VGAM363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10636] An enzyme complex designated DICER COMPLEX, `dices` the VGAM363 folded precursor RNA into VGAM363 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM363 RNA is designated SEQ ID:698, and is provided hereinbelow with reference to the sequence listing part.

[10637] VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM363 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[10638] VGAM363 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM363 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM363 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10639] The complementary binding of VGAM363 RNA, herein designated VGAM RNA, to host target binding sites on VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM363 host target RNA into VGAM363 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10640] It is appreciated that VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM363 host target genes. The mRNA of each one of this plurality of VGAM363 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM363 RNA, herein designated VGAM RNA, and which when bound by VGAM363 RNA causes inhibition of translation of respective one or more VGAM363 host target proteins.

[10641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM363 gene, herein designated VGAM GENE, on one or more VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[10642] It is yet further appreciated that a function of VGAM363 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM363 correlate with, and may be deduced from, the identity of the host target genes which VGAM363 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[10643] Nucleotide sequences of the VGAM363 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM363 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM363 are further described hereinbelow with reference to Table 1.

[10644] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM363 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM363 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10645] As mentioned hereinabove with reference to Fig. 1, a function of VGAM363 gene, herein designated VGAM is inhibition of expression of VGAM363 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM363 correlate with, and may be deduced from, the identity of the target genes which VGAM363 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10646] Archain 1 (ARCN1, Accession NM_001655) is a VGAM363 host target gene. ARCN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARCN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARCN1 BINDING SITE, designated SEQ ID:844, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10647] A function of VGAM363 is therefore inhibition of Archain 1 (ARCN1, Accession NM_001655), a gene which plays a

fundamental role in eukaryotic cell biology. Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARCN1. The function of ARCN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Cathepsin K (pseudosarcoma) (CTSK, Accession NM_000396) is another VGAM363 host target gene. CTSK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTSK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTSK BINDING SITE, designated SEQ ID:736, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10648] Another function of VGAM363 is therefore inhibition of Cathepsin K (pseudosarcoma) (CTSK, Accession NM_000396). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSK. High-mobility Group 20A (HMG20A, Accession NM_018200) is another VGAM363 host target gene. HMG20A BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMG20A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMG20A BINDING SITE, designated SEQ ID:1800, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10649] Another function of VGAM363 is therefore inhibition of High-mobility Group 20A (HMG20A, Accession NM_018200). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMG20A. PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_012231) is another VGAM363 host target gene. PRDM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:1415, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ

ID:698.

[10650] Another function of VGAM363 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_012231), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799) is another VGAM363 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:1060, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10651] Another function of VGAM363 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession

NM_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.

Src Family Associated Phosphoprotein 1 (SCAP1, Accession NM_003726) is another VGAM363 host target gene. SCAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAP1 BINDING SITE, designated SEQ ID:1052, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10652] Another function of VGAM363 is therefore inhibition of Src Family Associated Phosphoprotein 1 (SCAP1, Accession NM_003726). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAP1. Usher Syndrome

3A (USH3A, Accession NM_052995) is another VGAM363 host target gene. USH3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by USH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USH3A BINDING SITE, designated SEQ ID:2355, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10653] Another function of VGAM363 is therefore inhibition of Usher Syndrome 3A (USH3A, Accession NM_052995). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USH3A. Vesicle Amine Transport Protein 1 Homolog (T californica) (VAT1, Accession NM_006373) is another VGAM363 host target gene. VAT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAT1 BINDING SITE, designated SEQ ID:1292, to the nucleotide se-

quence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10654] Another function of VGAM363 is therefore inhibition of Vesicle Amine Transport Protein 1 Homolog (T californica) (VAT1, Accession NM_006373), a gene which is a membrane protein of cholinergic synaptic vesicles. Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAT1. The function of VAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Allograft Inflammatory Factor 1 (AIF1, Accession NM_032955) is another VGAM363 host target gene. AIF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AIF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AIF1 BINDING SITE, designated SEQ ID:2297, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10655] Another function of VGAM363 is therefore inhibition of Allograft Inflammatory Factor 1 (AIF1, Accession

NM_032955). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AIF1. Complexin 1 (CPLX1, Accession NM_006651) is another VGAM363 host target gene. CPLX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPLX1 BINDING SITE, designated SEQ ID:1317, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10656] Another function of VGAM363 is therefore inhibition of Complexin 1 (CPLX1, Accession NM_006651). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPLX1. CXYorf1 (Accession XM_088704) is another VGAM363 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:3228, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10657] Another function of VGAM363 is therefore inhibition of CXYorf1 (Accession XM_088704). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. FLJ12221 (Accession XM_031342) is another VGAM363 host target gene. FLJ12221 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12221 BINDING SITE, designated SEQ ID:2637, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10658] Another function of VGAM363 is therefore inhibition of FLJ12221 (Accession XM_031342). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12221. FLJ20207 (Accession NM_017711) is another VGAM363

host target gene. FLJ20207 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20207 BINDING SITE, designated SEQ ID:1741, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10659] Another function of VGAM363 is therefore inhibition of FLJ20207 (Accession NM_017711). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20207. FLJ22215 (Accession XM_173021) is another VGAM363 host target gene. FLJ22215 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22215 BINDING SITE, designated SEQ ID:3715, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10660] Another function of VGAM363 is therefore inhibition of FLJ22215 (Accession XM_173021). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22215. FLJ31547 (Accession NM_145024) is another VGAM363 host target gene. FLJ31547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31547 BINDING SITE, designated SEQ ID:2511, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10661] Another function of VGAM363 is therefore inhibition of FLJ31547 (Accession NM_145024). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31547. HSCBCIP1 (Accession XM_114210) is another VGAM363 host target gene. HSCBCIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSCBCIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSCBCIP1 BINDING SITE, designated SEQ ID:3449, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10662] Another function of VGAM363 is therefore inhibition of HSCBCIP1 (Accession XM_114210). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSCBCIP1. KIAA0515 (Accession XM_033380) is another VGAM363 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:2670, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10663] Another function of VGAM363 is therefore inhibition of KIAA0515 (Accession XM_033380). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0515. KIAA1514 (Accession NM_019064) is another VGAM363 host target gene. KIAA1514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1514 BINDING SITE, designated SEQ ID:1877, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10664] Another function of VGAM363 is therefore inhibition of KIAA1514 (Accession NM_019064). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1514. KIAA1553 (Accession XM_166320) is another VGAM363 host target gene. KIAA1553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1553 BINDING SITE, designated SEQ ID:3544, to the nucleotide sequence of VGAM363 RNA, herein designated

VGAM RNA, also designated SEQ ID:698.

[10665] Another function of VGAM363 is therefore inhibition of KIAA1553 (Accession XM_166320). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1553. KIAA1656 (Accession XM_038022) is another VGAM363 host target gene. KIAA1656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:2730, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10666] Another function of VGAM363 is therefore inhibition of KIAA1656 (Accession XM_038022). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. KIAA1877 (Accession XM_038616) is another VGAM363 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1877, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:2741, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10667] Another function of VGAM363 is therefore inhibition of KIAA1877 (Accession XM_038616). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877. MTCH1 (Accession NM_014341) is another VGAM363 host target gene. MTCH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTCH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTCH1 BINDING SITE, designated SEQ ID:1493, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10668] Another function of VGAM363 is therefore inhibition of MTCH1 (Accession NM_014341). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with MTCH1. N-PAC (Accession XM_048113) is another VGAM363 host target gene. N-PAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by N-PAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N-PAC BINDING SITE, designated SEQ ID:2902, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10669] Another function of VGAM363 is therefore inhibition of N-PAC (Accession XM_048113). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N-PAC. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4B (SEMA4B, Accession XM_044533) is another VGAM363 host target gene. SEMA4B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SEMA4B BINDING SITE, designated SEQ ID:2839, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10670] Another function of VGAM363 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4B (SEMA4B, Accession XM_044533). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4B. Sprouty Homolog 1, Antagonist of FGF Signaling (Drosophila) (SPRY1, Accession XM_036349) is another VGAM363 host target gene. SPRY1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPRY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPRY1 BINDING SITE, designated SEQ ID:2709, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10671] Another function of VGAM363 is therefore inhibition of Sprouty Homolog 1, Antagonist of FGF Signaling

(Drosophila) (SPRY1, Accession XM_036349). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY1. WS-3 (Accession NM_006571) is another VGAM363 host target gene. WS-3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WS-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WS-3 BINDING SITE, designated SEQ ID:1312, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10672] Another function of VGAM363 is therefore inhibition of WS-3 (Accession NM_006571). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WS-3. LOC123242 (Accession XM_063548) is another VGAM363 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:1313, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:699.

tarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:3030, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10673] Another function of VGAM363 is therefore inhibition of LOC123242 (Accession XM_063548). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC127702 (Accession XM_060619) is another VGAM363 host target gene. LOC127702 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127702 BINDING SITE, designated SEQ ID:3024, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10674] Another function of VGAM363 is therefore inhibition of LOC127702 (Accession XM_060619). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127702. LOC146745 (Accession XM_085577) is an-

other VGAM363 host target gene. LOC146745 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146745, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146745 BINDING SITE, designated SEQ ID:3099, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10675] Another function of VGAM363 is therefore inhibition of LOC146745 (Accession XM_085577). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146745. LOC147791 (Accession XM_097293) is another VGAM363 host target gene. LOC147791 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147791, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147791 BINDING SITE, designated SEQ ID:3294, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10676] Another function of VGAM363 is therefore inhibition of LOC147791 (Accession XM_097293). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147791. LOC196892 (Accession XM_113768) is another VGAM363 host target gene. LOC196892 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196892 BINDING SITE, designated SEQ ID:3417, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10677] Another function of VGAM363 is therefore inhibition of LOC196892 (Accession XM_113768). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196892. LOC200093 (Accession XM_032184) is another VGAM363 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:2648, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10678] Another function of VGAM363 is therefore inhibition of LOC200093 (Accession XM_032184). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC201243 (Accession XM_113935) is another VGAM363 host target gene. LOC201243 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201243 BINDING SITE, designated SEQ ID:3426, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10679] Another function of VGAM363 is therefore inhibition of LOC201243 (Accession XM_113935). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201243. LOC219404 (Accession XM_167909) is another VGAM363 host target gene. LOC219404 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219404, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219404 BINDING SITE, designated SEQ ID:3606, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10680] Another function of VGAM363 is therefore inhibition of LOC219404 (Accession XM_167909). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219404. LOC222066 (Accession XM_166582) is another VGAM363 host target gene. LOC222066 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222066, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222066 BINDING SITE, designated SEQ ID:3574, to the nucleotide sequence of VGAM363 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:698.

[10681] Another function of VGAM363 is therefore inhibition of LOC222066 (Accession XM_166582). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222066. LOC253001 (Accession XM_171711) is another VGAM363 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:3698, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10682] Another function of VGAM363 is therefore inhibition of LOC253001 (Accession XM_171711). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. LOC91040 (Accession XM_035641) is another VGAM363 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91040, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:2700, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:698.

[10683] Another function of VGAM363 is therefore inhibition of LOC91040 (Accession XM_035641). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 364(VGR364) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10684] VGR364 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR364 gene was detected is described hereinabove with reference to Figs. 1-9.

[10685] VGR364 gene encodes VGR364 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10686] VGR364 precursor RNA folds spatially, forming VGR364 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR364 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR364 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10687] VGR364 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM15 precursor RNA, VGAM16 precursor RNA, VGAM17 precursor RNA, VGAM18 precursor RNA, VGAM19 precursor RNA, VGAM20 precursor RNA, VGAM21 precursor RNA and VGAM22 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA

segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10688] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM15 RNA, VGAM16 RNA, VGAM17 RNA, VGAM18 RNA, VGAM19 RNA, VGAM20 RNA, VGAM21 RNA and VGAM22 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10689] VGAM15 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM15 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM15 host target RNA into VGAM15 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10690] VGAM16 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM16 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM16 host target RNA into VGAM16 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10691] VGAM17 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM17 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM17 host target RNA into VGAM17 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10692] VGAM18 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM18 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM18 host target RNA into VGAM18 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10693] VGAM19 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM19 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM19 host target RNA into VGAM19 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[10694] VGAM20 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM20 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM20 host target RNA into VGAM20 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10695] VGAM21 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM21 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM21 host target RNA into VGAM21 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10696] VGAM22 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM22 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM22 host target RNA into VGAM22 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10697] It is appreciated that a function of VGR364 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR364 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR364 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of

VGR364 gene: VGAM15 host target protein, VGAM16 host target protein, VGAM17 host target protein, VGAM18 host target protein, VGAM19 host target protein, VGAM20 host target protein, VGAM21 host target protein and VGAM22 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM15, VGAM16, VGAM17, VGAM18, VGAM19, VGAM20, VGAM21 and VGAM22. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 365(VGR365) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10698] VGR365 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR365 gene was detected is described hereinabove with reference to Figs. 1-9.

[10699] VGR365 gene encodes VGR365 precursor RNA, herein

designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10700] VGR365 precursor RNA folds spatially, forming VGR365 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR365 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR365 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10701] VGR365 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM23 precursor RNA, VGAM24 precursor RNA, VGAM25 precursor RNA, VGAM26 precursor RNA, VGAM27 precursor RNA, VGAM28 precursor RNA, VGAM29 precursor RNA and VGAM30 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR

RNA of Fig. 1.

[10702] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM23 RNA, VGAM24 RNA, VGAM25 RNA, VGAM26 RNA, VGAM27 RNA, VGAM28 RNA, VGAM29 RNA and VGAM30 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10703] VGAM23 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM23 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM23 host target RNA into VGAM23 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10704] VGAM24 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily

to a host target binding site located in an untranslated region of VGAM24 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM24 host target RNA into VGAM24 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10705] VGAM25 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM25 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM25 host target RNA into VGAM25 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10706] VGAM26 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM26 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM26 host target RNA into VGAM26 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10707] VGAM27 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM27 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM27 host target RNA into VGAM27 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10708] VGAM28 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM28 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM28 host target RNA into VGAM28 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10709] VGAM29 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM29 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM29 host target RNA into VGAM29 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[10710] VGAM30 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM30 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM30 host target RNA into VGAM30 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10711] It is appreciated that a function of VGR365 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR365 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR365 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR365 gene: VGAM23 host target protein, VGAM24 host

target protein, VGAM25 host target protein, VGAM26 host target protein, VGAM27 host target protein, VGAM28 host target protein, VGAM29 host target protein and VGAM30 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM30 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM23, VGAM24, VGAM25, VGAM26, VGAM27, VGAM28, VGAM29 and VGAM30. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 366 (VGR366) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10712] VGR366 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR366 gene was detected is described hereinabove with reference to Figs. 1-9.

[10713] VGR366 gene encodes VGR366 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typi-

cally several hundred nucleotides long.

[10714] VGR366 precursor RNA folds spatially, forming VGR366 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR366 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR366 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10715] VGR366 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM31 precursor RNA, VGAM32 precursor RNA, VGAM33 precursor RNA and VGAM34 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10716] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA

segments of about 22 nucleotides in length, VGAM31 RNA, VGAM32 RNA, VGAM33 RNA and VGAM34 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10717] VGAM31 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM31 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM31 host target RNA into VGAM31 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10718] VGAM32 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM32 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM32 host target RNA into VGAM32 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10719] VGAM33 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM33 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM33 host target RNA into VGAM33 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10720] VGAM34 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM34 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM34 host target RNA into VGAM34 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10721] It is appreciated that a function of VGR366 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR366 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR366 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR366 gene: VGAM31 host target protein, VGAM32 host target protein, VGAM33 host target protein and VGAM34 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM31, VGAM32, VGAM33 and VGAM34. Fig. 9 further provides a

conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 367(VGR367) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10722] VGR367 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR367 gene was detected is described hereinabove with reference to Figs. 1-9.

[10723] VGR367 gene encodes VGR367 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10724] VGR367 precursor RNA folds spatially, forming VGR367 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR367 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR367 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10725] VGR367 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM35 precursor RNA, VGAM36 precursor RNA, VGAM37 precursor RNA, VGAM38 precursor RNA, VGAM39 precursor RNA, VGAM40 precursor RNA, VGAM41 precursor RNA and VGAM42 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10726] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM35 RNA, VGAM36 RNA, VGAM37 RNA, VGAM38 RNA, VGAM39 RNA, VGAM40 RNA, VGAM41 RNA and VGAM42 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10727] VGAM35 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM35 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM35 host target RNA into VGAM35 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10728] VGAM36 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM36 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM36 host target RNA into VGAM36 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10729] VGAM37 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM37 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM37 host target RNA into VGAM37 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10730] VGAM38 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM38 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM38 host target RNA into VGAM38 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[10731] VGAM39 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM39 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM39 host target RNA into VGAM39 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10732] VGAM40 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM40 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM40 host target RNA into VGAM40 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10733] VGAM41 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM41 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM41 host target RNA into VGAM41 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10734] VGAM42 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM42 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM42 host target RNA into

VGAM42 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10735] It is appreciated that a function of VGR367 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR367 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR367 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR367 gene: VGAM35 host target protein, VGAM36 host target protein, VGAM37 host target protein, VGAM38 host target protein, VGAM39 host target protein, VGAM40 host target protein, VGAM41 host target protein and VGAM42 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM35, VGAM36, VGAM37, VGAM38, VGAM39, VGAM40, VGAM41 and VGAM42. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral

gene, referred to here as Viral Genomic Record

368(VGR368) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10736] VGR368 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR368 gene was detected is described hereinabove with reference to Figs. 1-9.

[10737] VGR368 gene encodes VGR368 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10738] VGR368 precursor RNA folds spatially, forming VGR368 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR368 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR368 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed se-

quence of the second half thereof, as is well known in the art.

[10739] VGR368 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM43 precursor RNA, VGAM44 precursor RNA, VGAM45 precursor RNA, VGAM46 precursor RNA, VGAM47 precursor RNA, VGAM48 precursor RNA, VGAM49 precursor RNA and VGAM50 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10740] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM43 RNA, VGAM44 RNA, VGAM45 RNA, VGAM46 RNA, VGAM47 RNA, VGAM48 RNA, VGAM49 RNA and VGAM50 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10741] VGAM43 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily

to a host target binding site located in an untranslated region of VGAM43 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM43 host target RNA into VGAM43 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10742] VGAM44 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM44 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM44 host target RNA into VGAM44 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10743] VGAM45 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM45 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM45 host target RNA into VGAM45 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10744] VGAM46 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM46 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM46 host target RNA into VGAM46 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10745] VGAM47 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM47 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM47 host target RNA into VGAM47 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10746] VGAM48 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM48 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM48 host target RNA into VGAM48 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[10747] VGAM49 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM49 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM49 host target RNA into VGAM49 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10748] VGAM50 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM50 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM50 host target RNA into VGAM50 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10749] It is appreciated that a function of VGR368 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR368 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR368 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR368 gene: VGAM43 host target protein, VGAM44 host target protein, VGAM45 host target protein, VGAM46 host target protein, VGAM47 host target protein, VGAM48 host target protein, VGAM49 host target protein and VGAM50 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM43, VGAM44, VGAM45, VGAM46, VGAM47, VGAM48, VGAM49 and VGAM50. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record

369(VGR369) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10750] VGR369 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR369 gene was detected is described hereinabove with reference to Figs. 1-9.

[10751] VGR369 gene encodes VGR369 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10752] VGR369 precursor RNA folds spatially, forming VGR369 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR369 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR369 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the

art.

[10753] VGR369 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM51 precursor RNA, VGAM52 precursor RNA, VGAM53 precursor RNA and VGAM54 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10754] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM51 RNA, VGAM52 RNA, VGAM53 RNA and VGAM54 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10755] VGAM51 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM51 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM51 host target RNA into VGAM51 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10756] VGAM52 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM52 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM52 host target RNA into VGAM52 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10757] VGAM53 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM53 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM53 host target RNA into VGAM53 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10758] VGAM54 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM54 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM54 host target RNA into VGAM54 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10759] It is appreciated that a function of VGR369 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR369 gene include

diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR369 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR369 gene: VGAM51 host target protein, VGAM52 host target protein, VGAM53 host target protein and VGAM54 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM51, VGAM52, VGAM53 and VGAM54. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 370(VGR370) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10760] VGR370 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR370 gene was detected is described hereinabove with reference to Figs.

1-9.

[10761] VGR370 gene encodes VGR370 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10762] VGR370 precursor RNA folds spatially, forming VGR370 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR370 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR370 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10763] VGR370 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM56 precursor RNA and VGAM57 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10764] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM56 RNA and VGAM57 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10765] VGAM56 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM56 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM56 host target RNA into VGAM56 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10766] VGAM57 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM57 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM57 host target RNA into VGAM57 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10767] It is appreciated that a function of VGR370 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR370 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR370 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR370 gene: VGAM56 host target protein and VGAM57 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM56 and VGAM57. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene,

referred to here as Viral Genomic Record 371(VGR371) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10768] VGR371 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR371 gene was detected is described hereinabove with reference to Figs. 1-9.

[10769] VGR371 gene encodes VGR371 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10770] VGR371 precursor RNA folds spatially, forming VGR371 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR371 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR371 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed se-

quence of the second half thereof, as is well known in the art.

[10771] VGR371 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM58 precursor RNA, VGAM59 precursor RNA, VGAM60 precursor RNA, VGAM61 precursor RNA, VGAM62 precursor RNA, VGAM63 precursor RNA, VGAM64 precursor RNA and VGAM65 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10772] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM58 RNA, VGAM59 RNA, VGAM60 RNA, VGAM61 RNA, VGAM62 RNA, VGAM63 RNA, VGAM64 RNA and VGAM65 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10773] VGAM58 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily

to a host target binding site located in an untranslated region of VGAM58 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM58 host target RNA into VGAM58 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10774] VGAM59 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM59 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM59 host target RNA into VGAM59 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10775] VGAM60 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM60 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM60 host target RNA into VGAM60 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10776] VGAM61 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM61 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM61 host target RNA into VGAM61 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10777] VGAM62 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM62 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM62 host target RNA into VGAM62 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10778] VGAM63 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM63 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM63 host target RNA into VGAM63 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[10779] VGAM64 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM64 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM64 host target RNA into VGAM64 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10780] VGAM65 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM65 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM65 host target RNA into VGAM65 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10781] It is appreciated that a function of VGR371 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR371 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR371 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR371 gene: VGAM58 host target protein, VGAM59 host target protein, VGAM60 host target protein, VGAM61 host target protein, VGAM62 host target protein, VGAM63 host target protein, VGAM64 host target protein and VGAM65 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM58, VGAM59, VGAM60, VGAM61, VGAM62, VGAM63, VGAM64 and VGAM65. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record

372(VGR372) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10782] VGR372 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR372 gene was detected is described hereinabove with reference to Figs. 1-9.

[10783] VGR372 gene encodes VGR372 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10784] VGR372 precursor RNA folds spatially, forming VGR372 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR372 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR372 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the

art.

[10785] VGR372 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM66 precursor RNA, VGAM67 precursor RNA and VGAM68 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10786] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM66 RNA, VGAM67 RNA and VGAM68 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10787] VGAM66 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM66 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM66 host target RNA into VGAM66 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10788] VGAM67 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM67 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM67 host target RNA into VGAM67 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10789] VGAM68 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM68 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM68 host target RNA into VGAM68 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10790] It is appreciated that a function of VGR372 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR372 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR372 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR372 gene: VGAM66 host target protein, VGAM67 host target protein and VGAM68 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM66, VGAM67 and VGAM68. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to

here as Viral Genomic Record 373(VGR373) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10791] VGR373 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR373 gene was detected is described hereinabove with reference to Figs. 1-9.

[10792] VGR373 gene encodes VGR373 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10793] VGR373 precursor RNA folds spatially, forming VGR373 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR373 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR373 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed se-

quence of the second half thereof, as is well known in the art.

[10794] VGR373 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM71 precursor RNA, VGAM72 precursor RNA and VGAM73 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10795] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM71 RNA, VGAM72 RNA and VGAM73 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10796] VGAM71 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM71 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM71 host target RNA into VGAM71 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10797] VGAM72 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM72 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM72 host target RNA into VGAM72 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10798] VGAM73 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM73 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM73 host target RNA into VGAM73 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10799] It is appreciated that a function of VGR373 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR373 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR373 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR373 gene: VGAM71 host target protein, VGAM72 host target protein and VGAM73 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM71, VGAM72 and VGAM73. Fig. 9 further provides a conceptual description of novel bioin-

formatically detected regulatory viral gene, referred to here as Viral Genomic Record 374(VGR374) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10800] VGR374 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR374 gene was detected is described hereinabove with reference to Figs. 1-9.

[10801] VGR374 gene encodes VGR374 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10802] VGR374 precursor RNA folds spatially, forming VGR374 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR374 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR374 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10803] VGR374 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM74 precursor RNA and VGAM75 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10804] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM74 RNA and VGAM75 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10805] VGAM74 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM74 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM74 host target RNA into VGAM74 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10806] VGAM75 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM75 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM75 host target RNA into VGAM75 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10807] It is appreciated that a function of VGR374 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR374 gene include diagnosis, prevention and treatment of viral infection by

Vaccinia Virus. Specific functions, and accordingly utilities, of VGR374 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR374 gene: VGAM74 host target protein and VGAM75 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM74 and VGAM75. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 375(VGR375) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10808] VGR375 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR375 gene was detected is described hereinabove with reference to Figs. 1-9.

[10809] VGR375 gene encodes VGR375 precursor RNA, herein

designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10810] VGR375 precursor RNA folds spatially, forming VGR375 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR375 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR375 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10811] VGR375 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM77 precursor RNA, VGAM78 precursor RNA and VGAM79 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10812] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA

segments of about 22 nucleotides in length, VGAM77 RNA, VGAM78 RNA and VGAM79 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10813] VGAM77 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM77 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM77 host target RNA into VGAM77 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10814] VGAM78 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM78 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM78 host target RNA into VGAM78 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10815] VGAM79 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM79 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM79 host target RNA into VGAM79 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10816] It is appreciated that a function of VGR375 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR375 gene include diagnosis, prevention and treatment of viral infection by

Vaccinia Virus. Specific functions, and accordingly utilities, of VGR375 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR375 gene: VGAM77 host target protein, VGAM78 host target protein and VGAM79 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM77, VGAM78 and VGAM79. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 376(VGR376) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10817] VGR376 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR376 gene was detected is described hereinabove with reference to Figs. 1-9.

[10818] VGR376 gene encodes VGR376 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10819] VGR376 precursor RNA folds spatially, forming VGR376 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR376 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR376 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10820] VGR376 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM81 precursor RNA, VGAM82 precursor RNA, VGAM83 precursor RNA, VGAM84 precursor RNA, VGAM85 precursor RNA, VGAM86 precursor RNA, VGAM87 precursor RNA and VGAM88 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA

segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10821] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM81 RNA, VGAM82 RNA, VGAM83 RNA, VGAM84 RNA, VGAM85 RNA, VGAM86 RNA, VGAM87 RNA and VGAM88 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10822] VGAM81 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM81 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM81 host target RNA into VGAM81 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10823] VGAM82 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM82 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM82 host target RNA into VGAM82 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10824] VGAM83 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM83 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM83 host target RNA into VGAM83 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10825] VGAM84 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM84 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM84 host target RNA into VGAM84 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10826] VGAM85 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM85 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM85 host target RNA into VGAM85 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[10827] VGAM86 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM86 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM86 host target RNA into VGAM86 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10828] VGAM87 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM87 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM87 host target RNA into VGAM87 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10829] VGAM88 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM88 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM88 host target RNA into VGAM88 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10830] It is appreciated that a function of VGR376 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR376 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR376 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of

VGR376 gene: VGAM81 host target protein, VGAM82 host target protein, VGAM83 host target protein, VGAM84 host target protein, VGAM85 host target protein, VGAM86 host target protein, VGAM87 host target protein and VGAM88 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM81, VGAM82, VGAM83, VGAM84, VGAM85, VGAM86, VGAM87 and VGAM88. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 377(VGR377) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10831] VGR377 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR377 gene was detected is described hereinabove with reference to Figs. 1-9.

[10832] VGR377 gene encodes VGR377 precursor RNA, herein

designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10833] VGR377 precursor RNA folds spatially, forming VGR377 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR377 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR377 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10834] VGR377 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 7 separate VGAM precursor RNAs, VGAM91 precursor RNA, VGAM92 precursor RNA, VGAM93 precursor RNA, VGAM94 precursor RNA, VGAM95 precursor RNA, VGAM96 precursor RNA and VGAM97 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10835] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM91 RNA, VGAM92 RNA, VGAM93 RNA, VGAM94 RNA, VGAM95 RNA, VGAM96 RNA and VGAM97 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10836] VGAM91 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM91 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM91 host target RNA into VGAM91 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10837] VGAM92 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM92 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM92 host target RNA into VGAM92 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10838] VGAM93 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM93 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM93 host target RNA into VGAM93 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10839] VGAM94 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily

to a host target binding site located in an untranslated region of VGAM94 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM94 host target RNA into VGAM94 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10840] VGAM95 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM95 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM95 host target RNA into VGAM95 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10841] VGAM96 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM96 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM96 host target RNA into VGAM96 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10842] VGAM97 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM97 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM97 host target RNA into VGAM97 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10843] It is appreciated that a function of VGR377 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR377 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR377 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR377 gene: VGAM91 host target protein, VGAM92 host target protein, VGAM93 host target protein, VGAM94 host target protein, VGAM95 host target protein, VGAM96 host target protein and VGAM97 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM91, VGAM92, VGAM93, VGAM94, VGAM95, VGAM96 and VGAM97. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 378(VGR378) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one

host target gene, the function and utility of which at least one host target gene is known in the art.

[10844] VGR378 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR378 gene was detected is described hereinabove with reference to Figs. 1-9.

[10845] VGR378 gene encodes VGR378 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10846] VGR378 precursor RNA folds spatially, forming VGR378 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR378 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR378 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10847] VGR378 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM

precursor RNAs, VGAM99 precursor RNA and VGAM100 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10848] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM99 RNA and VGAM100 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10849] VGAM99 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM99 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM99 host target RNA into VGAM99 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[10850] VGAM100 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM100 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM100 host target RNA into VGAM100 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10851] It is appreciated that a function of VGR378 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR378 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR378 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR378 gene: VGAM99 host target protein and VGAM100

host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM99 and VGAM100. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 379 (VGR379) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10852] VGR379 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR379 gene was detected is described hereinabove with reference to Figs. 1-9.

[10853] VGR379 gene encodes VGR379 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10854] VGR379 precursor RNA folds spatially, forming VGR379 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR379 folded

precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR379 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10855] VGR379 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM101 precursor RNA, VGAM102 precursor RNA and VGAM103 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10856] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM101 RNA, VGAM102 RNA and VGAM103 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of

Fig. 1.

[10857] VGAM101 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM101 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM101 host target RNA into VGAM101 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10858] VGAM102 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM102 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM102 host target RNA into VGAM102 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10859] VGAM103 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM103 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM103 host target RNA into VGAM103 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10860] It is appreciated that a function of VGR379 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR379 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR379 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of

VGR379 gene: VGAM101 host target protein, VGAM102 host target protein and VGAM103 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated herein—above with reference to VGAM101, VGAM102 and VGAM103. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 380(VGR380) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10861] VGR380 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR380 gene was detected is described hereinabove with reference to Figs. 1–9.

[10862] VGR380 gene encodes VGR380 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10863] VGR380 precursor RNA folds spatially, forming VGR380

folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR380 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR380 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10864] VGR380 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 5 separate VGAM precursor RNAs, VGAM104 precursor RNA, VGAM105 precursor RNA, VGAM106 precursor RNA, VGAM107 precursor RNA and VGAM108 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10865] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM104 RNA, VGAM105 RNA, VGAM106 RNA, VGAM107 RNA and

VGAM108 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10866] VGAM104 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM104 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM104 host target RNA into VGAM104 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10867] VGAM105 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM105 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM105 host target RNA into VGAM105 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10868] VGAM106 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM106 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM106 host target RNA into VGAM106 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10869] VGAM107 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM107 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM107 host target RNA into VGAM107 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10870] VGAM108 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM108 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM108 host target RNA into VGAM108 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10871] It is appreciated that a function of VGR380 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR380 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities,

of VGR380 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR380 gene: VGAM104 host target protein, VGAM105 host target protein, VGAM106 host target protein, VGAM107 host target protein and VGAM108 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM104, VGAM105, VGAM106, VGAM107 and VGAM108. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 381(VGR381) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10872] VGR381 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR381 gene was detected is described hereinabove with reference to Figs. 1-9.

[10873] VGR381 gene encodes VGR381 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10874] VGR381 precursor RNA folds spatially, forming VGR381 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR381 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR381 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10875] VGR381 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM110 precursor RNA, VGAM111 precursor RNA, VGAM112 precursor RNA, VGAM113 precursor RNA, VGAM114 precursor RNA, VGAM115 precursor RNA, VGAM116 precursor RNA and VGAM117 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA

segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10876] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM110 RNA, VGAM111 RNA, VGAM112 RNA, VGAM113 RNA, VGAM114 RNA, VGAM115 RNA, VGAM116 RNA and VGAM117 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10877] VGAM110 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM110 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM110 host target RNA into VGAM110 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10878] VGAM111 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM111 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM111 host target RNA into VGAM111 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10879] VGAM112 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM112 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM112 host target RNA into VGAM112 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10880] VGAM113 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM113 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM113 host target RNA into VGAM113 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10881] VGAM114 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM114 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM114 host target RNA into VGAM114 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[10882] VGAM115 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM115 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM115 host target RNA into VGAM115 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10883] VGAM116 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM116 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM116 host target RNA into VGAM116 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10884] VGAM117 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM117 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM117 host target RNA into VGAM117 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10885] It is appreciated that a function of VGR381 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR381 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR381 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of

VGR381 gene: VGAM110 host target protein, VGAM111 host target protein, VGAM112 host target protein, VGAM113 host target protein, VGAM114 host target protein, VGAM115 host target protein, VGAM116 host target protein and VGAM117 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM110, VGAM111, VGAM112, VGAM113, VGAM114, VGAM115, VGAM116 and VGAM117. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 382(VGR382) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10886] VGR382 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR382 gene was detected is described hereinabove with reference to Figs. 1-9.

[10887] VGR382 gene encodes VGR382 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10888] VGR382 precursor RNA folds spatially, forming VGR382 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR382 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR382 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10889] VGR382 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM118 precursor RNA, VGAM119 precursor RNA, VGAM120 precursor RNA and VGAM121 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10890] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM118 RNA, VGAM119 RNA, VGAM120 RNA and VGAM121 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10891] VGAM118 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM118 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM118 host target RNA into VGAM118 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10892] VGAM119 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM119 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM119 host target RNA into VGAM119 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10893] VGAM120 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM120 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM120 host target RNA into VGAM120 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10894] VGAM121 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM121 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM121 host target RNA into VGAM121 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10895] It is appreciated that a function of VGR382 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR382 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR382 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR382 gene: VGAM118 host target protein, VGAM119 host target protein, VGAM120 host target protein and VGAM121 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target

genes is elaborated hereinabove with reference to VGAM118, VGAM119, VGAM120 and VGAM121. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 383 (VGR383) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10896] VGR383 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR383 gene was detected is described hereinabove with reference to Figs. 1-9.

[10897] VGR383 gene encodes VGR383 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10898] VGR383 precursor RNA folds spatially, forming VGR383 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR383 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures

are due to the fact that the nucleotide sequence of VGR383 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10899] VGR383 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM123 precursor RNA and VGAM124 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10900] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM123 RNA and VGAM124 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10901] VGAM123 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM123 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM123 host target RNA into VGAM123 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10902] VGAM124 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM124 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM124 host target RNA into VGAM124 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10903] It is appreciated that a function of VGR383 gene, herein designated VGR GENE, is inhibition of expression of host

target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR383 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR383 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR383 gene: VGAM123 host target protein and VGAM124 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM123 and VGAM124. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 384(VGR384) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10904] VGR384 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR384 gene was

detected is described hereinabove with reference to Figs. 1-9.

[10905] VGR384 gene encodes VGR384 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10906] VGR384 precursor RNA folds spatially, forming VGR384 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR384 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR384 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10907] VGR384 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM125 precursor RNA and VGAM126 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM

FOLDED PRECURSOR RNA of Fig. 1.

- [10908] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM125 RNA and VGAM126 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.
- [10909] VGAM125 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM125 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM125 host target RNA into VGAM125 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.
- [10910] VGAM126 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM126 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM126 host target RNA into VGAM126 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10911] It is appreciated that a function of VGR384 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR384 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR384 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR384 gene: VGAM125 host target protein and VGAM126 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM125 and VGAM126. Fig. 9 further provides a concep-

tual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 385(VGR385) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10912] VGR385 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR385 gene was detected is described hereinabove with reference to Figs. 1-9.

[10913] VGR385 gene encodes VGR385 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10914] VGR385 precursor RNA folds spatially, forming VGR385 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR385 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR385 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10915] VGR385 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM127 precursor RNA and VGAM128 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10916] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM127 RNA and VGAM128 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10917] VGAM127 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM127 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM127 host target RNA into VGAM127 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10918] VGAM128 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM128 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM128 host target RNA into VGAM128 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10919] It is appreciated that a function of VGR385 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR385 gene include diagnosis, prevention and treatment of viral infection by

Vaccinia Virus. Specific functions, and accordingly utilities, of VGR385 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR385 gene: VGAM127 host target protein and VGAM128 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM127 and VGAM128. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 386(VGR386) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10920] VGR386 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR386 gene was detected is described hereinabove with reference to Figs. 1-9.

[10921] VGR386 gene encodes VGR386 precursor RNA, herein

designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10922] VGR386 precursor RNA folds spatially, forming VGR386 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR386 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR386 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10923] VGR386 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM130 precursor RNA, VGAM131 precursor RNA and VGAM132 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10924] The above mentioned VGAM precursor RNAs are `diced`

by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM130 RNA, VGAM131 RNA and VGAM132 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10925] VGAM130 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM130 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM130 host target RNA into VGAM130 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10926] VGAM131 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM131 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM131 host target RNA into VGAM131 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10927] VGAM132 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM132 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM132 host target RNA into VGAM132 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10928] It is appreciated that a function of VGR386 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR386 gene include

diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR386 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR386 gene: VGAM130 host target protein, VGAM131 host target protein and VGAM132 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated herein—above with reference to VGAM130, VGAM131 and VGAM132. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 387(VGR387) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10929] VGR387 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR387 gene was detected is described hereinabove with reference to Figs.

1-9.

[10930] VGR387 gene encodes VGR387 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10931] VGR387 precursor RNA folds spatially, forming VGR387 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR387 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR387 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10932] VGR387 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 7 separate VGAM precursor RNAs, VGAM133 precursor RNA, VGAM134 precursor RNA, VGAM135 precursor RNA, VGAM136 precursor RNA, VGAM137 precursor RNA, VGAM138 precursor RNA and VGAM139 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor

sor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10933] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM133 RNA, VGAM134 RNA, VGAM135 RNA, VGAM136 RNA, VGAM137 RNA, VGAM138 RNA and VGAM139 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10934] VGAM133 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM133 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM133 host target RNA into VGAM133 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10935] VGAM134 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM134 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM134 host target RNA into VGAM134 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10936] VGAM135 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM135 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM135 host target RNA into VGAM135 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10937] VGAM136 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM136 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM136 host target RNA into VGAM136 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10938] VGAM137 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM137 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM137 host target RNA into VGAM137 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[10939] VGAM138 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM138 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM138 host target RNA into VGAM138 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10940] VGAM139 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM139 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM139 host target RNA into VGAM139 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10941] It is appreciated that a function of VGR387 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR387 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR387 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR387 gene: VGAM133 host target protein, VGAM134 host target protein, VGAM135 host target protein, VGAM136 host target protein, VGAM137 host target protein, VGAM138 host target protein and VGAM139 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM133, VGAM134, VGAM135, VGAM136, VGAM137, VGAM138 and VGAM139. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record

388(VGR388) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10942] VGR388 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR388 gene was detected is described hereinabove with reference to Figs. 1-9.

[10943] VGR388 gene encodes VGR388 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10944] VGR388 precursor RNA folds spatially, forming VGR388 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR388 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR388 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the

art.

[10945] VGR388 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM140 precursor RNA and VGAM141 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10946] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM140 RNA and VGAM141 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10947] VGAM140 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM140 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM140 host target RNA into VGAM140 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10948] VGAM141 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM141 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM141 host target RNA into VGAM141 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10949] It is appreciated that a function of VGR388 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR388 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR388 gene correlate with, and may be deduced from,

the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR388 gene: VGAM140 host target protein and VGAM141 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM140 and VGAM141. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 389(VGR389) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10950] VGR389 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR389 gene was detected is described hereinabove with reference to Figs. 1-9.

[10951] VGR389 gene encodes VGR389 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10952] VGR389 precursor RNA folds spatially, forming VGR389 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR389 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR389 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10953] VGR389 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 6 separate VGAM precursor RNAs, VGAM142 precursor RNA, VGAM143 precursor RNA, VGAM144 precursor RNA, VGAM145 precursor RNA, VGAM146 precursor RNA and VGAM147 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10954] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA

segments of about 22 nucleotides in length, VGAM142 RNA, VGAM143 RNA, VGAM144 RNA, VGAM145 RNA, VGAM146 RNA and VGAM147 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10955] VGAM142 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM142 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM142 host target RNA into VGAM142 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10956] VGAM143 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM143 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM143 host target RNA into VGAM143 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10957] VGAM144 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM144 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM144 host target RNA into VGAM144 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10958] VGAM145 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM145 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM145 host target RNA into VGAM145 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10959] VGAM146 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM146 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM146 host target RNA into VGAM146 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10960] VGAM147 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM147 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM147 host target RNA into VGAM147 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10961] It is appreciated that a function of VGR389 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR389 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR389 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR389 gene: VGAM142 host target protein, VGAM143 host target protein, VGAM144 host target protein, VGAM145 host target protein, VGAM146 host target protein and VGAM147 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of

these host target genes is elaborated hereinabove with reference to VGAM142, VGAM143, VGAM144, VGAM145, VGAM146 and VGAM147. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 390 (VGR390) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10962] VGR390 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR390 gene was detected is described hereinabove with reference to Figs. 1-9.

[10963] VGR390 gene encodes VGR390 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10964] VGR390 precursor RNA folds spatially, forming VGR390 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR390 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures

are due to the fact that the nucleotide sequence of VGR390 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10965] VGR390 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM148 precursor RNA and VGAM149 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10966] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM148 RNA and VGAM149 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10967] VGAM148 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM148 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM148 host target RNA into VGAM148 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10968] VGAM149 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM149 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM149 host target RNA into VGAM149 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10969] It is appreciated that a function of VGR390 gene, herein designated VGR GENE, is inhibition of expression of host

target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR390 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR390 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR390 gene: VGAM148 host target protein and VGAM149 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM148 and VGAM149. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 391(VGR391) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10970] VGR391 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR391 gene was

detected is described hereinabove with reference to Figs. 1-9.

[10971] VGR391 gene encodes VGR391 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10972] VGR391 precursor RNA folds spatially, forming VGR391 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR391 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR391 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10973] VGR391 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM150 precursor RNA and VGAM151 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM

FOLDED PRECURSOR RNA of Fig. 1.

- [10974] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM150 RNA and VGAM151 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.
- [10975] VGAM150 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM150 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM150 host target RNA into VGAM150 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.
- [10976] VGAM151 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM151 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM151 host target RNA into VGAM151 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10977] It is appreciated that a function of VGR391 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR391 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR391 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR391 gene: VGAM150 host target protein and VGAM151 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM150 and VGAM151. Fig. 9 further provides a concep-

tual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 392(VGR392) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10978] VGR392 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR392 gene was detected is described hereinabove with reference to Figs. 1-9.

[10979] VGR392 gene encodes VGR392 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10980] VGR392 precursor RNA folds spatially, forming VGR392 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR392 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR392 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10981] VGR392 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM154 precursor RNA, VGAM155 precursor RNA, VGAM156 precursor RNA and VGAM157 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10982] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM154 RNA, VGAM155 RNA, VGAM156 RNA and VGAM157 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10983] VGAM154 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM154 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM154 host target RNA into VGAM154 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10984] VGAM155 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM155 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM155 host target RNA into VGAM155 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10985] VGAM156 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM156 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM156 host target RNA into VGAM156 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10986] VGAM157 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM157 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM157 host target RNA into VGAM157 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10987] It is appreciated that a function of VGR392 gene, herein designated VGR GENE, is inhibition of expression of host

target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR392 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR392 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR392 gene: VGAM154 host target protein, VGAM155 host target protein, VGAM156 host target protein and VGAM157 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM154, VGAM155, VGAM156 and VGAM157. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 393(VGR393) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10988] VGR393 gene, herein designated VGR GENE, is a novel

bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR393 gene was detected is described hereinabove with reference to Figs. 1-9.

[10989] VGR393 gene encodes VGR393 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[10990] VGR393 precursor RNA folds spatially, forming VGR393 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR393 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR393 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[10991] VGR393 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 5 separate VGAM precursor RNAs, VGAM158 precursor RNA, VGAM159 precursor RNA, VGAM160 precursor RNA, VGAM161 precursor RNA and VGAM162 precursor RNA, herein schemati-

cally represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[10992] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM158 RNA, VGAM159 RNA, VGAM160 RNA, VGAM161 RNA and VGAM162 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[10993] VGAM158 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM158 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM158 host target RNA into VGAM158 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10994] VGAM159 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM159 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM159 host target RNA into VGAM159 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10995] VGAM160 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM160 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM160 host target RNA into VGAM160 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[10996] VGAM161 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM161 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM161 host target RNA into VGAM161 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10997] VGAM162 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM162 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM162 host target RNA into VGAM162 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[10998] It is appreciated that a function of VGR393 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR393 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR393 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR393 gene: VGAM158 host target protein, VGAM159 host target protein, VGAM160 host target protein, VGAM161 host target protein and VGAM162 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM158, VGAM159, VGAM160, VGAM161 and VGAM162. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 394(VGR394) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like

genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[10999] VGR394 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR394 gene was detected is described hereinabove with reference to Figs. 1-9.

[11000] VGR394 gene encodes VGR394 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11001] VGR394 precursor RNA folds spatially, forming VGR394 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR394 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR394 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11002] VGR394 folded precursor RNA is naturally processed by

cellular enzymatic activity into at least 6 separate VGAM precursor RNAs, VGAM163 precursor RNA, VGAM164 precursor RNA, VGAM165 precursor RNA, VGAM166 precursor RNA, VGAM167 precursor RNA and VGAM168 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11003] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM163 RNA, VGAM164 RNA, VGAM165 RNA, VGAM166 RNA, VGAM167 RNA and VGAM168 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11004] VGAM163 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM163 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM163 host target RNA into VGAM163 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11005] VGAM164 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM164 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM164 host target RNA into VGAM164 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11006] VGAM165 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM165 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM165 host target RNA into VGAM165 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11007] VGAM166 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM166 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM166 host target RNA into VGAM166 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11008] VGAM167 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM167 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM167 host target RNA into VGAM167 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11009] VGAM168 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM168 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM168 host target RNA into VGAM168 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11010] It is appreciated that a function of VGR394 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR394 gene include

diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR394 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR394 gene: VGAM163 host target protein, VGAM164 host target protein, VGAM165 host target protein, VGAM166 host target protein, VGAM167 host target protein and VGAM168 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM163, VGAM164, VGAM165, VGAM166, VGAM167 and VGAM168. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 395(VGR395) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11011] VGR395 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding,

RNA viral gene. The method by which VGR395 gene was detected is described hereinabove with reference to Figs. 1-9.

[11012] VGR395 gene encodes VGR395 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11013] VGR395 precursor RNA folds spatially, forming VGR395 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR395 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR395 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11014] VGR395 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM169 precursor RNA and VGAM170 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a

hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11015] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM169 RNA and VGAM170 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11016] VGAM169 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM169 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM169 host target RNA into VGAM169 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11017] VGAM170 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM170 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM170 host target RNA into VGAM170 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11018] It is appreciated that a function of VGR395 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR395 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR395 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR395 gene: VGAM169 host target protein and VGAM170 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to

VGAM169 and VGAM170. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 396 (VGR396) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11019] VGR396 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR396 gene was detected is described hereinabove with reference to Figs. 1-9.

[11020] VGR396 gene encodes VGR396 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11021] VGR396 precursor RNA folds spatially, forming VGR396 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR396 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR396 precursor RNA comprises a plurality of segments,

the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11022] VGR396 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM171 precursor RNA and VGAM172 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11023] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM171 RNA and VGAM172 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11024] VGAM171 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM171 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM171 host target RNA into VGAM171 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11025] VGAM172 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM172 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM172 host target RNA into VGAM172 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11026] It is appreciated that a function of VGR396 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR396 gene include

diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR396 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR396 gene: VGAM171 host target protein and VGAM172 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM171 and VGAM172. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 397(VGR397) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11027] VGR397 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR397 gene was detected is described hereinabove with reference to Figs. 1-9.

[11028] VGR397 gene encodes VGR397 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11029] VGR397 precursor RNA folds spatially, forming VGR397 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR397 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR397 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11030] VGR397 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM173 precursor RNA and VGAM174 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11031] The above mentioned VGAM precursor RNAs are `diced`

by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM173 RNA and VGAM174 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11032] VGAM173 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM173 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM173 host target RNA into VGAM173 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11033] VGAM174 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM174 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM174 host target RNA into VGAM174 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11034] It is appreciated that a function of VGR397 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR397 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR397 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR397 gene: VGAM173 host target protein and VGAM174 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM173 and VGAM174. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record

398(VGR398) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11035] VGR398 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR398 gene was detected is described hereinabove with reference to Figs. 1-9.

[11036] VGR398 gene encodes VGR398 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11037] VGR398 precursor RNA folds spatially, forming VGR398 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR398 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR398 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the

art.

[11038] VGR398 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM175 precursor RNA and VGAM176 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11039] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM175 RNA and VGAM176 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11040] VGAM175 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM175 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM175 host target RNA into VGAM175 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11041] VGAM176 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM176 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM176 host target RNA into VGAM176 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11042] It is appreciated that a function of VGR398 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR398 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR398 gene correlate with, and may be deduced from,

the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR398 gene: VGAM175 host target protein and VGAM176 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM175 and VGAM176. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 399(VGR399) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11043] VGR399 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR399 gene was detected is described hereinabove with reference to Figs. 1-9.

[11044] VGR399 gene encodes VGR399 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11045] VGR399 precursor RNA folds spatially, forming VGR399 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR399 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR399 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11046] VGR399 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM177 precursor RNA, VGAM178 precursor RNA, VGAM179 precursor RNA and VGAM180 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11047] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM177

RNA, VGAM178 RNA, VGAM179 RNA and VGAM180 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11048] VGAM177 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM177 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM177 host target RNA into VGAM177 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11049] VGAM178 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM178 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM178 host target RNA into VGAM178 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11050] VGAM179 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM179 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM179 host target RNA into VGAM179 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11051] VGAM180 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM180 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM180 host target RNA into VGAM180 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11052] It is appreciated that a function of VGR399 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR399 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR399 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR399 gene: VGAM177 host target protein, VGAM178 host target protein, VGAM179 host target protein and VGAM180 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM177, VGAM178, VGAM179 and VGAM180. Fig. 9 further provides a conceptual description of novel bioinfor-

matically detected regulatory viral gene, referred to here as Viral Genomic Record 400(VGR400) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11053] VGR400 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR400 gene was detected is described hereinabove with reference to Figs. 1-9.

[11054] VGR400 gene encodes VGR400 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11055] VGR400 precursor RNA folds spatially, forming VGR400 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR400 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR400 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11056] VGR400 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 7 separate VGAM precursor RNAs, VGAM181 precursor RNA, VGAM182 precursor RNA, VGAM183 precursor RNA, VGAM184 precursor RNA, VGAM185 precursor RNA, VGAM186 precursor RNA and VGAM187 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11057] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM181 RNA, VGAM182 RNA, VGAM183 RNA, VGAM184 RNA, VGAM185 RNA, VGAM186 RNA and VGAM187 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11058] VGAM181 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily

to a host target binding site located in an untranslated region of VGAM181 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM181 host target RNA into VGAM181 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11059] VGAM182 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM182 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM182 host target RNA into VGAM182 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11060] VGAM183 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM183 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM183 host target RNA into VGAM183 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11061] VGAM184 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM184 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM184 host target RNA into VGAM184 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11062] VGAM185 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM185 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM185 host target RNA into VGAM185 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11063] VGAM186 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM186 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM186 host target RNA into VGAM186 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[11064] VGAM187 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM187 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM187 host target RNA into VGAM187 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11065] It is appreciated that a function of VGR400 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR400 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR400 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR400 gene: VGAM181 host target protein, VGAM182

host target protein, VGAM183 host target protein, VGAM184 host target protein, VGAM185 host target protein, VGAM186 host target protein and VGAM187 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM181, VGAM182, VGAM183, VGAM184, VGAM185, VGAM186 and VGAM187. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 401 (VGR401) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11066] VGR401 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR401 gene was detected is described hereinabove with reference to Figs. 1-9.

[11067] VGR401 gene encodes VGR401 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typi-

cally several hundred nucleotides long.

[11068] VGR401 precursor RNA folds spatially, forming VGR401 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR401 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR401 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11069] VGR401 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM188 precursor RNA and VGAM189 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11070] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM188

RNA and VGAM189 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11071] VGAM188 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM188 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM188 host target RNA into VGAM188 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11072] VGAM189 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM189 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM189 host target RNA into VGAM189 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11073] It is appreciated that a function of VGR401 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR401 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR401 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR401 gene: VGAM188 host target protein and VGAM189 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM188 and VGAM189. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 402(VGR402) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which

in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11074] VGR402 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR402 gene was detected is described hereinabove with reference to Figs. 1-9.

[11075] VGR402 gene encodes VGR402 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11076] VGR402 precursor RNA folds spatially, forming VGR402 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR402 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR402 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11077] VGR402 folded precursor RNA is naturally processed by

cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM193 precursor RNA and VGAM194 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11078] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM193 RNA and VGAM194 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11079] VGAM193 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM193 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM193 host target RNA into VGAM193 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11080] VGAM194 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM194 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM194 host target RNA into VGAM194 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11081] It is appreciated that a function of VGR402 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR402 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR402 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of

VGR402 gene: VGAM193 host target protein and VGAM194 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM193 and VGAM194. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 403(VGR403) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11082] VGR403 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR403 gene was detected is described hereinabove with reference to Figs. 1-9.

[11083] VGR403 gene encodes VGR403 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11084] VGR403 precursor RNA folds spatially, forming VGR403 folded precursor RNA, herein designated VGR FOLDED

PRECURSOR RNA. It is appreciated that VGR403 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR403 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11085] VGR403 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM195 precursor RNA, VGAM196 precursor RNA and VGAM197 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11086] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM195 RNA, VGAM196 RNA and VGAM197 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA,

each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11087] VGAM195 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM195 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM195 host target RNA into VGAM195 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11088] VGAM196 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM196 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM196 host target RNA into

VGAM196 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11089] VGAM197 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM197 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM197 host target RNA into VGAM197 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11090] It is appreciated that a function of VGR403 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR403 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR403 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited

by VGAM RNAs comprised in the `operon-like` cluster of VGR403 gene: VGAM195 host target protein, VGAM196 host target protein and VGAM197 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM195, VGAM196 and VGAM197. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 404(VGR404) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11091] VGR404 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR404 gene was detected is described hereinabove with reference to Figs. 1-9.

[11092] VGR404 gene encodes VGR404 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11093] VGR404 precursor RNA folds spatially, forming VGR404 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR404 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR404 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11094] VGR404 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM198 precursor RNA, VGAM199 precursor RNA and VGAM200 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11095] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM198

RNA, VGAM199 RNA and VGAM200 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11096] VGAM198 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM198 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM198 host target RNA into VGAM198 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11097] VGAM199 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM199 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM199 host target RNA into VGAM199 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11098] VGAM200 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM200 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM200 host target RNA into VGAM200 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11099] It is appreciated that a function of VGR404 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR404 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities,

of VGR404 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR404 gene: VGAM198 host target protein, VGAM199 host target protein and VGAM200 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated herein-above with reference to VGAM198, VGAM199 and VGAM200. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 405(VGR405) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11100] VGR405 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR405 gene was detected is described hereinabove with reference to Figs. 1-9.

[11101] VGR405 gene encodes VGR405 precursor RNA, herein

designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11102] VGR405 precursor RNA folds spatially, forming VGR405 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR405 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR405 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11103] VGR405 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM201 precursor RNA and VGAM202 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11104] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA

segments of about 22 nucleotides in length, VGAM201 RNA and VGAM202 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11105] VGAM201 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM201 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM201 host target RNA into VGAM201 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11106] VGAM202 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM202 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM202 host target RNA into VGAM202 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11107] It is appreciated that a function of VGR405 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR405 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR405 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR405 gene: VGAM201 host target protein and VGAM202 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM201 and VGAM202. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 406(VGR406) viral gene, which encodes an `operon-like`

cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11108] VGR406 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR406 gene was detected is described hereinabove with reference to Figs. 1-9.

[11109] VGR406 gene encodes VGR406 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11110] VGR406 precursor RNA folds spatially, forming VGR406 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR406 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR406 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11111] VGR406 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM203 precursor RNA, VGAM204 precursor RNA and VGAM205 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11112] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM203 RNA, VGAM204 RNA and VGAM205 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11113] VGAM203 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM203 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM203 host target RNA into VGAM203 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11114] VGAM204 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM204 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM204 host target RNA into VGAM204 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11115] VGAM205 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM205 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM205 host target RNA into VGAM205 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11116] It is appreciated that a function of VGR406 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR406 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR406 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR406 gene: VGAM203 host target protein, VGAM204 host target protein and VGAM205 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM203, VGAM204 and VGAM205. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene,

referred to here as Viral Genomic Record 407(VGR407) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11117] VGR407 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR407 gene was detected is described hereinabove with reference to Figs. 1-9.

[11118] VGR407 gene encodes VGR407 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11119] VGR407 precursor RNA folds spatially, forming VGR407 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR407 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR407 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed se-

quence of the second half thereof, as is well known in the art.

[11120] VGR407 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM206 precursor RNA, VGAM207 precursor RNA, VGAM208 precursor RNA and VGAM209 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11121] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM206 RNA, VGAM207 RNA, VGAM208 RNA and VGAM209 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11122] VGAM206 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM206 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM206 host target RNA into VGAM206 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11123] VGAM207 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM207 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM207 host target RNA into VGAM207 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11124] VGAM208 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM208 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM208 host target RNA into VGAM208 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11125] VGAM209 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM209 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM209 host target RNA into VGAM209 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11126] It is appreciated that a function of VGR407 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attack–

ing a host. Accordingly, utilities of VGR407 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR407 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR407 gene: VGAM206 host target protein, VGAM207 host target protein, VGAM208 host target protein and VGAM209 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM206, VGAM207, VGAM208 and VGAM209. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 408(VGR408) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11127] VGR408 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding,

RNA viral gene. The method by which VGR408 gene was detected is described hereinabove with reference to Figs. 1-9.

[11128] VGR408 gene encodes VGR408 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11129] VGR408 precursor RNA folds spatially, forming VGR408 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR408 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR408 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11130] VGR408 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM210 precursor RNA, VGAM211 precursor RNA, VGAM212 precursor RNA and VGAM213 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR,

each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11131] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM210 RNA, VGAM211 RNA, VGAM212 RNA and VGAM213 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11132] VGAM210 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM210 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM210 host target RNA into VGAM210 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11133] VGAM211 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM211 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM211 host target RNA into VGAM211 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11134] VGAM212 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM212 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM212 host target RNA into VGAM212 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11135] VGAM213 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM213 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM213 host target RNA into VGAM213 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11136] It is appreciated that a function of VGR408 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR408 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR408 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR408 gene: VGAM210 host target protein, VGAM211 host target protein, VGAM212 host target protein and

VGAM213 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM210, VGAM211, VGAM212 and VGAM213. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 409(VGR409) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

- [11137] VGR409 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR409 gene was detected is described hereinabove with reference to Figs. 1-9.
- [11138] VGR409 gene encodes VGR409 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [11139] VGR409 precursor RNA folds spatially, forming VGR409 folded precursor RNA, herein designated VGR FOLDED

PRECURSOR RNA. It is appreciated that VGR409 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR409 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11140] VGR409 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM214 precursor RNA, VGAM215 precursor RNA, VGAM216 precursor RNA and VGAM217 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11141] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM214 RNA, VGAM215 RNA, VGAM216 RNA and VGAM217 RNA, herein schematically represented by VGAM1 RNA through

VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11142] VGAM214 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM214 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM214 host target RNA into VGAM214 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11143] VGAM215 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM215 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM215 host target RNA into

VGAM215 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11144] VGAM216 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM216 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM216 host target RNA into VGAM216 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11145] VGAM217 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM217 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM217 host target RNA into VGAM217 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11146] It is appreciated that a function of VGR409 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR409 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR409 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR409 gene: VGAM214 host target protein, VGAM215 host target protein, VGAM216 host target protein and VGAM217 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM214, VGAM215, VGAM216 and VGAM217. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 410(VGR410) viral gene, which

encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11147] VGR410 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR410 gene was detected is described hereinabove with reference to Figs. 1-9.

[11148] VGR410 gene encodes VGR410 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11149] VGR410 precursor RNA folds spatially, forming VGR410 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR410 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR410 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the

art.

[11150] VGR410 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM219 precursor RNA, VGAM220 precursor RNA and VGAM221 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11151] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM219 RNA, VGAM220 RNA and VGAM221 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11152] VGAM219 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM219 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM219 host target RNA into VGAM219 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11153] VGAM220 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM220 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM220 host target RNA into VGAM220 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11154] VGAM221 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM221 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM221 host target RNA into VGAM221 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11155] It is appreciated that a function of VGR410 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR410 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR410 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR410 gene: VGAM219 host target protein, VGAM220 host target protein and VGAM221 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated herein-above with reference to VGAM219, VGAM220 and VGAM221. Fig. 9 further provides a conceptual description

of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 411(VGR411) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11156] VGR411 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR411 gene was detected is described hereinabove with reference to Figs. 1-9.

[11157] VGR411 gene encodes VGR411 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11158] VGR411 precursor RNA folds spatially, forming VGR411 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR411 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR411 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11159] VGR411 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM222 precursor RNA and VGAM223 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11160] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM222 RNA and VGAM223 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11161] VGAM222 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM222 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM222 host target RNA into VGAM222 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11162] VGAM223 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM223 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM223 host target RNA into VGAM223 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11163] It is appreciated that a function of VGR411 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR411 gene include diagnosis, prevention and treatment of viral infection by

Vaccinia Virus. Specific functions, and accordingly utilities, of VGR411 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR411 gene: VGAM222 host target protein and VGAM223 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM222 and VGAM223. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 412(VGR412) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11164] VGR412 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR412 gene was detected is described hereinabove with reference to Figs. 1-9.

[11165] VGR412 gene encodes VGR412 precursor RNA, herein

designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11166] VGR412 precursor RNA folds spatially, forming VGR412 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR412 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR412 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11167] VGR412 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM224 precursor RNA, VGAM225 precursor RNA, VGAM226 precursor RNA and VGAM227 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11168] The above mentioned VGAM precursor RNAs are `diced`

by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM224 RNA, VGAM225 RNA, VGAM226 RNA and VGAM227 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11169] VGAM224 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM224 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM224 host target RNA into VGAM224 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11170] VGAM225 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM225 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM225 host target RNA into VGAM225 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11171] VGAM226 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM226 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM226 host target RNA into VGAM226 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11172] VGAM227 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM227 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM227 host target RNA into VGAM227 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11173] It is appreciated that a function of VGR412 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR412 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR412 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR412 gene: VGAM224 host target protein, VGAM225 host target protein, VGAM226 host target protein and VGAM227 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to

VGAM224, VGAM225, VGAM226 and VGAM227. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 413 (VGR413) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11174] VGR413 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR413 gene was detected is described hereinabove with reference to Figs. 1-9.

[11175] VGR413 gene encodes VGR413 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11176] VGR413 precursor RNA folds spatially, forming VGR413 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR413 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of

VGR413 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11177] VGR413 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM230 precursor RNA, VGAM231 precursor RNA, VGAM232 precursor RNA and VGAM233 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11178] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM230 RNA, VGAM231 RNA, VGAM232 RNA and VGAM233 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11179] VGAM230 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily

to a host target binding site located in an untranslated region of VGAM230 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM230 host target RNA into VGAM230 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11180] VGAM231 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM231 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM231 host target RNA into VGAM231 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11181] VGAM232 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM232 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM232 host target RNA into VGAM232 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11182] VGAM233 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM233 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM233 host target RNA into VGAM233 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11183] It is appreciated that a function of VGR413 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR413 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR413 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR413 gene: VGAM230 host target protein, VGAM231 host target protein, VGAM232 host target protein and VGAM233 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM230, VGAM231, VGAM232 and VGAM233. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 414(VGR414) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in

the art.

[11184] VGR414 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR414 gene was detected is described hereinabove with reference to Figs. 1-9.

[11185] VGR414 gene encodes VGR414 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11186] VGR414 precursor RNA folds spatially, forming VGR414 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR414 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR414 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11187] VGR414 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM234 precursor RNA and VGAM235

precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11188] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM234 RNA and VGAM235 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11189] VGAM234 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM234 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM234 host target RNA into VGAM234 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11190] VGAM235 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM235 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM235 host target RNA into VGAM235 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11191] It is appreciated that a function of VGR414 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR414 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR414 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR414 gene: VGAM234 host target protein and VGAM235 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM234 and VGAM235. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 415 (VGR415) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11192] VGR415 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR415 gene was detected is described hereinabove with reference to Figs. 1-9.

[11193] VGR415 gene encodes VGR415 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11194] VGR415 precursor RNA folds spatially, forming VGR415 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR415 folded precursor RNA comprises a plurality of what is known in

the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR415 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11195] VGR415 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM237 precursor RNA and VGAM238 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11196] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM237 RNA and VGAM238 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11197] VGAM237 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily

to a host target binding site located in an untranslated region of VGAM237 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM237 host target RNA into VGAM237 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11198] VGAM238 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM238 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM238 host target RNA into VGAM238 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11199] It is appreciated that a function of VGR415 gene, herein

designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR415 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR415 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR415 gene: VGAM237 host target protein and VGAM238 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM237 and VGAM238. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 416(VGR416) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11200] VGR416 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding,

RNA viral gene. The method by which VGR416 gene was detected is described hereinabove with reference to Figs. 1-9.

[11201] VGR416 gene encodes VGR416 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11202] VGR416 precursor RNA folds spatially, forming VGR416 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR416 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR416 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11203] VGR416 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM240 precursor RNA and VGAM241 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a

hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11204] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM240 RNA and VGAM241 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11205] VGAM240 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM240 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM240 host target RNA into VGAM240 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11206] VGAM241 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM241 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM241 host target RNA into VGAM241 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11207] It is appreciated that a function of VGR416 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR416 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR416 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR416 gene: VGAM240 host target protein and VGAM241 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to

VGAM240 and VGAM241. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 417 (VGR417) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11208] VGR417 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR417 gene was detected is described hereinabove with reference to Figs. 1-9.

[11209] VGR417 gene encodes VGR417 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11210] VGR417 precursor RNA folds spatially, forming VGR417 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR417 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR417 precursor RNA comprises a plurality of segments,

the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11211] VGR417 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM243 precursor RNA, VGAM244 precursor RNA, VGAM245 precursor RNA and VGAM246 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11212] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM243 RNA, VGAM244 RNA, VGAM245 RNA and VGAM246 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11213] VGAM243 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM243 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM243 host target RNA into VGAM243 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11214] VGAM244 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM244 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM244 host target RNA into VGAM244 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11215] VGAM245 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily

to a host target binding site located in an untranslated region of VGAM245 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM245 host target RNA into VGAM245 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11216] VGAM246 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM246 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM246 host target RNA into VGAM246 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11217] It is appreciated that a function of VGR417 gene, herein

designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR417 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR417 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR417 gene: VGAM243 host target protein, VGAM244 host target protein, VGAM245 host target protein and VGAM246 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM243, VGAM244, VGAM245 and VGAM246. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 418(VGR418) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11218] VGR418 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR418 gene was detected is described hereinabove with reference to Figs. 1-9.

[11219] VGR418 gene encodes VGR418 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11220] VGR418 precursor RNA folds spatially, forming VGR418 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR418 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR418 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11221] VGR418 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM247 precursor RNA, VGAM248 precursor RNA, VGAM249 precursor RNA and VGAM250 pre-

cursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11222] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM247 RNA, VGAM248 RNA, VGAM249 RNA and VGAM250 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11223] VGAM247 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM247 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM247 host target RNA into VGAM247 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[11224] VGAM248 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM248 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM248 host target RNA into VGAM248 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11225] VGAM249 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM249 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM249 host target RNA into VGAM249 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11226] VGAM250 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM250 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM250 host target RNA into VGAM250 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[11227] It is appreciated that a function of VGR418 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR418 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR418 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR418 gene: VGAM247 host target protein, VGAM248 host target protein, VGAM249 host target protein and VGAM250 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM247, VGAM248, VGAM249 and VGAM250. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 419(VGR419) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and

utility of which at least one host target gene is known in the art.

[11228] VGR419 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR419 gene was detected is described hereinabove with reference to Figs. 1-9.

[11229] VGR419 gene encodes VGR419 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11230] VGR419 precursor RNA folds spatially, forming VGR419 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR419 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR419 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11231] VGR419 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM

precursor RNAs, VGAM253 precursor RNA, VGAM254 precursor RNA and VGAM255 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11232] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM253 RNA, VGAM254 RNA and VGAM255 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11233] VGAM253 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM253 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM253 host target RNA into

VGAM253 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11234] VGAM254 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM254 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM254 host target RNA into VGAM254 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11235] VGAM255 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM255 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM255 host target RNA into VGAM255 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11236] It is appreciated that a function of VGR419 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR419 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR419 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR419 gene: VGAM253 host target protein, VGAM254 host target protein and VGAM255 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated herein-above with reference to VGAM253, VGAM254 and VGAM255. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 420(VGR420) viral gene, which encodes an `operon-like` cluster of novel

viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11237] VGR420 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR420 gene was detected is described hereinabove with reference to Figs. 1-9.

[11238] VGR420 gene encodes VGR420 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11239] VGR420 precursor RNA folds spatially, forming VGR420 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR420 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR420 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11240] VGR420 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM256 precursor RNA and VGAM257 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11241] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM256 RNA and VGAM257 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11242] VGAM256 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM256 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM256 host target RNA into

VGAM256 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11243] VGAM257 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM257 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM257 host target RNA into VGAM257 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11244] It is appreciated that a function of VGR420 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR420 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR420 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited

by VGAM RNAs comprised in the `operon-like` cluster of VGR420 gene: VGAM256 host target protein and VGAM257 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM256 and VGAM257. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 421(VGR421) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11245] VGR421 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR421 gene was detected is described hereinabove with reference to Figs. 1-9.

[11246] VGR421 gene encodes VGR421 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11247] VGR421 precursor RNA folds spatially, forming VGR421

folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR421 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR421 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11248] VGR421 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM263 precursor RNA, VGAM264 precursor RNA and VGAM265 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11249] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM263 RNA, VGAM264 RNA and VGAM265 RNA, herein schemati-

cally represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11250] VGAM263 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM263 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM263 host target RNA into VGAM263 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11251] VGAM264 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM264 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM264 host target RNA into VGAM264 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11252] VGAM265 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM265 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM265 host target RNA into VGAM265 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11253] It is appreciated that a function of VGR421 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR421 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR421 gene correlate with, and may be deduced from,

the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR421 gene: VGAM263 host target protein, VGAM264 host target protein and VGAM265 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated herein—above with reference to VGAM263, VGAM264 and VGAM265. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 422(VGR422) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11254] VGR422 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR422 gene was detected is described hereinabove with reference to Figs. 1–9.

[11255] VGR422 gene encodes VGR422 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typi—

cally several hundred nucleotides long.

[11256] VGR422 precursor RNA folds spatially, forming VGR422 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR422 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR422 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11257] VGR422 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM266 precursor RNA and VGAM267 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11258] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM266

RNA and VGAM267 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11259] VGAM266 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM266 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM266 host target RNA into VGAM266 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11260] VGAM267 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM267 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM267 host target RNA into VGAM267 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11261] It is appreciated that a function of VGR422 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR422 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR422 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR422 gene: VGAM266 host target protein and VGAM267 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM266 and VGAM267. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 423(VGR423) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which

in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11262] VGR423 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR423 gene was detected is described hereinabove with reference to Figs. 1-9.

[11263] VGR423 gene encodes VGR423 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11264] VGR423 precursor RNA folds spatially, forming VGR423 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR423 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR423 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11265] VGR423 folded precursor RNA is naturally processed by

cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM268 precursor RNA, VGAM269 precursor RNA and VGAM270 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11266] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM268 RNA, VGAM269 RNA and VGAM270 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11267] VGAM268 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM268 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM268 host target RNA into VGAM268 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11268] VGAM269 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM269 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM269 host target RNA into VGAM269 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11269] VGAM270 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM270 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM270 host target RNA into VGAM270 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11270] It is appreciated that a function of VGR423 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR423 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR423 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR423 gene: VGAM268 host target protein, VGAM269 host target protein and VGAM270 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated herein-above with reference to VGAM268, VGAM269 and VGAM270. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 424(VGR424) vi-

ral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11271] VGR424 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR424 gene was detected is described hereinabove with reference to Figs. 1-9.

[11272] VGR424 gene encodes VGR424 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11273] VGR424 precursor RNA folds spatially, forming VGR424 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR424 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR424 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the

art.

[11274] VGR424 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM272 precursor RNA and VGAM273 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11275] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM272 RNA and VGAM273 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11276] VGAM272 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM272 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM272 host target RNA into VGAM272 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11277] VGAM273 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM273 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM273 host target RNA into VGAM273 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11278] It is appreciated that a function of VGR424 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR424 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR424 gene correlate with, and may be deduced from,

the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR424 gene: VGAM272 host target protein and VGAM273 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM272 and VGAM273. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 425(VGR425) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11279] VGR425 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR425 gene was detected is described hereinabove with reference to Figs. 1-9.

[11280] VGR425 gene encodes VGR425 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11281] VGR425 precursor RNA folds spatially, forming VGR425 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR425 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR425 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11282] VGR425 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM274 precursor RNA, VGAM275 precursor RNA, VGAM276 precursor RNA and VGAM277 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11283] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM274

RNA, VGAM275 RNA, VGAM276 RNA and VGAM277 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11284] VGAM274 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM274 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM274 host target RNA into VGAM274 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11285] VGAM275 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM275 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM275 host target RNA into VGAM275 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11286] VGAM276 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM276 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM276 host target RNA into VGAM276 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11287] VGAM277 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM277 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM277 host target RNA into VGAM277 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11288] It is appreciated that a function of VGR425 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR425 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR425 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR425 gene: VGAM274 host target protein, VGAM275 host target protein, VGAM276 host target protein and VGAM277 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM274, VGAM275, VGAM276 and VGAM277. Fig. 9 further provides a conceptual description of novel bioinfor-

matically detected regulatory viral gene, referred to here as Viral Genomic Record 426(VGR426) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11289] VGR426 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR426 gene was detected is described hereinabove with reference to Figs. 1-9.

[11290] VGR426 gene encodes VGR426 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11291] VGR426 precursor RNA folds spatially, forming VGR426 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR426 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR426 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11292] VGR426 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 5 separate VGAM precursor RNAs, VGAM279 precursor RNA, VGAM280 precursor RNA, VGAM281 precursor RNA, VGAM282 precursor RNA and VGAM283 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11293] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM279 RNA, VGAM280 RNA, VGAM281 RNA, VGAM282 RNA and VGAM283 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11294] VGAM279 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM279 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM279 host target RNA into VGAM279 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11295] VGAM280 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM280 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM280 host target RNA into VGAM280 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11296] VGAM281 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM281 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM281 host target RNA into VGAM281 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11297] VGAM282 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM282 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM282 host target RNA into VGAM282 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11298] VGAM283 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily

to a host target binding site located in an untranslated region of VGAM283 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM283 host target RNA into VGAM283 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11299] It is appreciated that a function of VGR426 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR426 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR426 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR426 gene: VGAM279 host target protein, VGAM280 host target protein, VGAM281 host target protein, VGAM282 host target protein and VGAM283 host target protein, herein schematically represented by VGAM1 HOST

TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN.

The function of these host target genes is elaborated hereinabove with reference to VGAM279, VGAM280, VGAM281, VGAM282 and VGAM283. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 427 (VGR427) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11300] VGR427 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR427 gene was detected is described hereinabove with reference to Figs. 1-9.

[11301] VGR427 gene encodes VGR427 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11302] VGR427 precursor RNA folds spatially, forming VGR427 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR427 folded precursor RNA comprises a plurality of what is known in

the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR427 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11303] VGR427 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM288 precursor RNA, VGAM289 precursor RNA, VGAM290 precursor RNA and VGAM291 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11304] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM288 RNA, VGAM289 RNA, VGAM290 RNA and VGAM291 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11305] VGAM288 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM288 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM288 host target RNA into VGAM288 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11306] VGAM289 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM289 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM289 host target RNA into VGAM289 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[11307] VGAM290 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM290 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM290 host target RNA into VGAM290 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11308] VGAM291 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM291 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM291 host target RNA into VGAM291 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11309] It is appreciated that a function of VGR427 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR427 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR427 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR427 gene: VGAM288 host target protein, VGAM289 host target protein, VGAM290 host target protein and VGAM291 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM288, VGAM289, VGAM290 and VGAM291. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 428(VGR428) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expres-

sion of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11310] VGR428 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR428 gene was detected is described hereinabove with reference to Figs. 1-9.

[11311] VGR428 gene encodes VGR428 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11312] VGR428 precursor RNA folds spatially, forming VGR428 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR428 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR428 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11313] VGR428 folded precursor RNA is naturally processed by

cellular enzymatic activity into at least 3 separate VGAM precursor RNAs, VGAM292 precursor RNA, VGAM293 precursor RNA and VGAM294 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11314] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM292 RNA, VGAM293 RNA and VGAM294 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11315] VGAM292 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM292 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM292 host target RNA into VGAM292 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11316] VGAM293 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM293 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM293 host target RNA into VGAM293 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11317] VGAM294 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM294 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM294 host target RNA into VGAM294 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11318] It is appreciated that a function of VGR428 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR428 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR428 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR428 gene: VGAM292 host target protein, VGAM293 host target protein and VGAM294 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated herein-above with reference to VGAM292, VGAM293 and VGAM294. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 429(VGR429) vi-

ral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11319] VGR429 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR429 gene was detected is described hereinabove with reference to Figs. 1-9.

[11320] VGR429 gene encodes VGR429 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11321] VGR429 precursor RNA folds spatially, forming VGR429 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR429 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR429 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the

art.

[11322] VGR429 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 6 separate VGAM precursor RNAs, VGAM295 precursor RNA, VGAM296 precursor RNA, VGAM297 precursor RNA, VGAM298 precursor RNA, VGAM299 precursor RNA and VGAM300 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11323] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM295 RNA, VGAM296 RNA, VGAM297 RNA, VGAM298 RNA, VGAM299 RNA and VGAM300 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11324] VGAM295 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM295 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM295 host target RNA into VGAM295 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11325] VGAM296 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM296 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM296 host target RNA into VGAM296 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11326] VGAM297 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM297 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM297 host target RNA into VGAM297 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11327] VGAM298 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM298 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM298 host target RNA into VGAM298 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11328] VGAM299 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM299 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM299 host target RNA into VGAM299 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11329] VGAM300 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM300 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM300 host target RNA into VGAM300 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11330] It is appreciated that a function of VGR429 gene, herein designated VGR GENE, is inhibition of expression of host

target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR429 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR429 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR429 gene: VGAM295 host target protein, VGAM296 host target protein, VGAM297 host target protein, VGAM298 host target protein, VGAM299 host target protein and VGAM300 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM295, VGAM296, VGAM297, VGAM298, VGAM299 and VGAM300. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 430(VGR430) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11331] VGR430 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR430 gene was detected is described hereinabove with reference to Figs. 1-9.

[11332] VGR430 gene encodes VGR430 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11333] VGR430 precursor RNA folds spatially, forming VGR430 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR430 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR430 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11334] VGR430 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM303 precursor RNA, VGAM304 precursor RNA, VGAM305 precursor RNA, VGAM306 precursor

sor RNA, VGAM307 precursor RNA, VGAM308 precursor RNA, VGAM309 precursor RNA and VGAM310 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11335] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM303 RNA, VGAM304 RNA, VGAM305 RNA, VGAM306 RNA, VGAM307 RNA, VGAM308 RNA, VGAM309 RNA and VGAM310 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11336] VGAM303 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM303 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM303 host target RNA into VGAM303 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11337] VGAM304 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM304 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM304 host target RNA into VGAM304 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11338] VGAM305 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM305 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM305 host target RNA into VGAM305 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11339] VGAM306 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM306 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM306 host target RNA into VGAM306 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11340] VGAM307 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM307 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM307 host target RNA into VGAM307 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11341] VGAM308 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM308 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM308 host target RNA into VGAM308 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11342] VGAM309 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM309 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through

VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM309 host target RNA into VGAM309 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11343] VGAM310 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM310 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM310 host target RNA into VGAM310 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11344] It is appreciated that a function of VGR430 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR430 gene include

diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR430 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR430 gene: VGAM303 host target protein, VGAM304 host target protein, VGAM305 host target protein, VGAM306 host target protein, VGAM307 host target protein, VGAM308 host target protein, VGAM309 host target protein and VGAM310 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM303, VGAM304, VGAM305, VGAM306, VGAM307, VGAM308, VGAM309 and VGAM310. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 431(VGR431) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11345] VGR431 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR431 gene was detected is described hereinabove with reference to Figs. 1-9.

[11346] VGR431 gene encodes VGR431 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11347] VGR431 precursor RNA folds spatially, forming VGR431 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR431 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR431 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11348] VGR431 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM311 precursor RNA, VGAM312 precursor RNA, VGAM313 precursor RNA and VGAM314 pre-

cursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11349] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM311 RNA, VGAM312 RNA, VGAM313 RNA and VGAM314 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11350] VGAM311 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM311 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM311 host target RNA into VGAM311 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[11351] VGAM312 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM312 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM312 host target RNA into VGAM312 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11352] VGAM313 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM313 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM313 host target RNA into VGAM313 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11353] VGAM314 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM314 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM314 host target RNA into VGAM314 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11354] It is appreciated that a function of VGR431 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR431 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR431 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of

VGR431 gene: VGAM311 host target protein, VGAM312 host target protein, VGAM313 host target protein and VGAM314 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM311, VGAM312, VGAM313 and VGAM314. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 432(VGR432) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11355] VGR432 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR432 gene was detected is described hereinabove with reference to Figs. 1-9.

[11356] VGR432 gene encodes VGR432 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11357] VGR432 precursor RNA folds spatially, forming VGR432 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR432 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR432 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11358] VGR432 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 4 separate VGAM precursor RNAs, VGAM316 precursor RNA, VGAM317 precursor RNA, VGAM318 precursor RNA and VGAM319 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11359] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM316

RNA, VGAM317 RNA, VGAM318 RNA and VGAM319 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11360] VGAM316 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM316 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM316 host target RNA into VGAM316 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11361] VGAM317 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM317 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM317 host target RNA into VGAM317 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11362] VGAM318 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM318 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM318 host target RNA into VGAM318 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11363] VGAM319 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM319 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM319 host target RNA into VGAM319 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11364] It is appreciated that a function of VGR432 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR432 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR432 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR432 gene: VGAM316 host target protein, VGAM317 host target protein, VGAM318 host target protein and VGAM319 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM316, VGAM317, VGAM318 and VGAM319. Fig. 9 further provides a conceptual description of novel bioinfor-

matically detected regulatory viral gene, referred to here as Viral Genomic Record 433(VGR433) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11365] VGR433 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR433 gene was detected is described hereinabove with reference to Figs. 1-9.

[11366] VGR433 gene encodes VGR433 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11367] VGR433 precursor RNA folds spatially, forming VGR433 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR433 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR433 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11368] VGR433 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM320 precursor RNA, VGAM321 precursor RNA, VGAM322 precursor RNA, VGAM323 precursor RNA, VGAM324 precursor RNA, VGAM325 precursor RNA, VGAM326 precursor RNA and VGAM327 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11369] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM320 RNA, VGAM321 RNA, VGAM322 RNA, VGAM323 RNA, VGAM324 RNA, VGAM325 RNA, VGAM326 RNA and VGAM327 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11370] VGAM320 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM320 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM320 host target RNA into VGAM320 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11371] VGAM321 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM321 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM321 host target RNA into VGAM321 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11372] VGAM322 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM322 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM322 host target RNA into VGAM322 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11373] VGAM323 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM323 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM323 host target RNA into VGAM323 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[11374] VGAM324 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM324 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM324 host target RNA into VGAM324 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11375] VGAM325 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM325 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM325 host target RNA into VGAM325 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11376] VGAM326 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM326 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM326 host target RNA into VGAM326 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11377] VGAM327 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM327 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM327 host target RNA into

VGAM327 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11378] It is appreciated that a function of VGR433 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR433 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR433 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR433 gene: VGAM320 host target protein, VGAM321 host target protein, VGAM322 host target protein, VGAM323 host target protein, VGAM324 host target protein, VGAM325 host target protein, VGAM326 host target protein and VGAM327 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM320, VGAM321, VGAM322, VGAM323, VGAM324, VGAM325, VGAM326 and VGAM327. Fig. 9 further provides a conceptual description

of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 434(VGR434) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11379] VGR434 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR434 gene was detected is described hereinabove with reference to Figs. 1-9.

[11380] VGR434 gene encodes VGR434 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11381] VGR434 precursor RNA folds spatially, forming VGR434 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR434 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR434 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11382] VGR434 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM328 precursor RNA, VGAM329 precursor RNA, VGAM330 precursor RNA, VGAM331 precursor RNA, VGAM332 precursor RNA, VGAM333 precursor RNA, VGAM334 precursor RNA and VGAM335 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11383] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM328 RNA, VGAM329 RNA, VGAM330 RNA, VGAM331 RNA, VGAM332 RNA, VGAM333 RNA, VGAM334 RNA and VGAM335 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11384] VGAM328 RNA, herein schematically represented by

VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM328 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM328 host target RNA into VGAM328 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11385] VGAM329 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM329 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM329 host target RNA into VGAM329 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11386] VGAM330 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM330 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM330 host target RNA into VGAM330 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11387] VGAM331 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM331 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM331 host target RNA into VGAM331 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[11388] VGAM332 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM332 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM332 host target RNA into VGAM332 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11389] VGAM333 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM333 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM333 host target RNA into VGAM333 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11390] VGAM334 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM334 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM334 host target RNA into VGAM334 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11391] VGAM335 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM335 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM335 host target RNA into

VGAM335 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11392] It is appreciated that a function of VGR434 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR434 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR434 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR434 gene: VGAM328 host target protein, VGAM329 host target protein, VGAM330 host target protein, VGAM331 host target protein, VGAM332 host target protein, VGAM333 host target protein, VGAM334 host target protein and VGAM335 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM328, VGAM329, VGAM330, VGAM331, VGAM332, VGAM333, VGAM334 and VGAM335. Fig. 9 further provides a conceptual description

of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 435(VGR435) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11393] VGR435 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR435 gene was detected is described hereinabove with reference to Figs. 1-9.

[11394] VGR435 gene encodes VGR435 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11395] VGR435 precursor RNA folds spatially, forming VGR435 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR435 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR435 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11396] VGR435 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 5 separate VGAM precursor RNAs, VGAM336 precursor RNA, VGAM337 precursor RNA, VGAM338 precursor RNA, VGAM339 precursor RNA and VGAM340 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11397] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM336 RNA, VGAM337 RNA, VGAM338 RNA, VGAM339 RNA and VGAM340 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11398] VGAM336 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM336 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM336 host target RNA into VGAM336 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11399] VGAM337 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM337 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM337 host target RNA into VGAM337 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11400] VGAM338 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated re-

gion of VGAM338 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM338 host target RNA into VGAM338 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11401] VGAM339 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM339 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM339 host target RNA into VGAM339 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11402] VGAM340 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily

to a host target binding site located in an untranslated region of VGAM340 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM340 host target RNA into VGAM340 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11403] It is appreciated that a function of VGR435 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR435 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR435 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR435 gene: VGAM336 host target protein, VGAM337 host target protein, VGAM338 host target protein, VGAM339 host target protein and VGAM340 host target protein, herein schematically represented by VGAM1 HOST

TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN.

The function of these host target genes is elaborated hereinabove with reference to VGAM336, VGAM337, VGAM338, VGAM339 and VGAM340. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 436 (VGR436) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11404] VGR436 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR436 gene was detected is described hereinabove with reference to Figs. 1-9.

[11405] VGR436 gene encodes VGR436 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11406] VGR436 precursor RNA folds spatially, forming VGR436 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR436 folded precursor RNA comprises a plurality of what is known in

the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR436 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11407] VGR436 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 7 separate VGAM precursor RNAs, VGAM341 precursor RNA, VGAM342 precursor RNA, VGAM343 precursor RNA, VGAM344 precursor RNA, VGAM345 precursor RNA, VGAM346 precursor RNA and VGAM347 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11408] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM341 RNA, VGAM342 RNA, VGAM343 RNA, VGAM344 RNA, VGAM345 RNA, VGAM346 RNA and VGAM347 RNA, herein schematically represented by VGAM1 RNA through VGAM3

RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11409] VGAM341 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM341 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM341 host target RNA into VGAM341 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11410] VGAM342 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM342 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM342 host target RNA into

VGAM342 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11411] VGAM343 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM343 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM343 host target RNA into VGAM343 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11412] VGAM344 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM344 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM344 host target RNA into VGAM344 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11413] VGAM345 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM345 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM345 host target RNA into VGAM345 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11414] VGAM346 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM346 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM346 host target RNA into VGAM346 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11415] VGAM347 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM347 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM347 host target RNA into VGAM347 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11416] It is appreciated that a function of VGR436 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR436 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities,

of VGR436 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR436 gene: VGAM341 host target protein, VGAM342 host target protein, VGAM343 host target protein, VGAM344 host target protein, VGAM345 host target protein, VGAM346 host target protein and VGAM347 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM341, VGAM342, VGAM343, VGAM344, VGAM345, VGAM346 and VGAM347. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 437(VGR437) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11417] VGR437 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR437 gene was

detected is described hereinabove with reference to Figs. 1-9.

[11418] VGR437 gene encodes VGR437 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11419] VGR437 precursor RNA folds spatially, forming VGR437 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR437 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR437 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11420] VGR437 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 8 separate VGAM precursor RNAs, VGAM348 precursor RNA, VGAM349 precursor RNA, VGAM350 precursor RNA, VGAM351 precursor RNA, VGAM352 precursor RNA, VGAM353 precursor RNA, VGAM354 precursor RNA and VGAM355 precursor RNA, herein schematically represented by VGAM1 FOLDED

PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11421] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM348 RNA, VGAM349 RNA, VGAM350 RNA, VGAM351 RNA, VGAM352 RNA, VGAM353 RNA, VGAM354 RNA and VGAM355 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11422] VGAM348 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM348 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM348 host target RNA into VGAM348 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3

HOST TARGET PROTEIN, all of Fig. 1.

[11423] VGAM349 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM349 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM349 host target RNA into VGAM349 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11424] VGAM350 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM350 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM350 host target RNA into VGAM350 host target protein, herein schematically repre-

sented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11425] VGAM351 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM351 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM351 host target RNA into VGAM351 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11426] VGAM352 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM352 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM352 host target RNA into

VGAM352 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11427] VGAM353 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM353 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM353 host target RNA into VGAM353 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11428] VGAM354 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM354 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby

inhibiting translation of VGAM354 host target RNA into VGAM354 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11429] VGAM355 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM355 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM355 host target RNA into VGAM355 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11430] It is appreciated that a function of VGR437 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR437 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR437 gene correlate with, and may be deduced from,

the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR437 gene: VGAM348 host target protein, VGAM349 host target protein, VGAM350 host target protein, VGAM351 host target protein, VGAM352 host target protein, VGAM353 host target protein, VGAM354 host target protein and VGAM355 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM348, VGAM349, VGAM350, VGAM351, VGAM352, VGAM353, VGAM354 and VGAM355. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 438(VGR438) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11431] VGR438 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR438 gene was

detected is described hereinabove with reference to Figs. 1-9.

[11432] VGR438 gene encodes VGR438 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11433] VGR438 precursor RNA folds spatially, forming VGR438 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR438 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR438 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11434] VGR438 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM356 precursor RNA and VGAM357 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM

FOLDED PRECURSOR RNA of Fig. 1.

- [11435] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM356 RNA and VGAM357 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.
- [11436] VGAM356 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM356 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM356 host target RNA into VGAM356 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.
- [11437] VGAM357 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM357 host target RNA, herein schematically

represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM357 host target RNA into VGAM357 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11438] It is appreciated that a function of VGR438 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR438 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR438 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR438 gene: VGAM356 host target protein and VGAM357 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM356 and VGAM357. Fig. 9 further provides a concep-

tual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 439(VGR439) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11439] VGR439 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR439 gene was detected is described hereinabove with reference to Figs. 1-9.

[11440] VGR439 gene encodes VGR439 precursor RNA, herein designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11441] VGR439 precursor RNA folds spatially, forming VGR439 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR439 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR439 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide

sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11442] VGR439 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM358 precursor RNA and VGAM359 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11443] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA segments of about 22 nucleotides in length, VGAM358 RNA and VGAM359 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11444] VGAM358 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM358 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site

corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM358 host target RNA into VGAM358 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11445] VGAM359 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM359 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM359 host target RNA into VGAM359 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11446] It is appreciated that a function of VGR439 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR439 gene include diagnosis, prevention and treatment of viral infection by

Vaccinia Virus. Specific functions, and accordingly utilities, of VGR439 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR439 gene: VGAM358 host target protein and VGAM359 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM358 and VGAM359. Fig. 9 further provides a conceptual description of novel bioinformatically detected regulatory viral gene, referred to here as Viral Genomic Record 440(VGR440) viral gene, which encodes an `operon-like` cluster of novel viral micro RNA-like genes, each of which in turn modulates expression of at least one host target gene, the function and utility of which at least one host target gene is known in the art.

[11447] VGR440 gene, herein designated VGR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA viral gene. The method by which VGR440 gene was detected is described hereinabove with reference to Figs. 1-9.

[11448] VGR440 gene encodes VGR440 precursor RNA, herein

designated VGR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[11449] VGR440 precursor RNA folds spatially, forming VGR440 folded precursor RNA, herein designated VGR FOLDED PRECURSOR RNA. It is appreciated that VGR440 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of VGR440 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[11450] VGR440 folded precursor RNA is naturally processed by cellular enzymatic activity into at least 2 separate VGAM precursor RNAs, VGAM361 precursor RNA and VGAM362 precursor RNA, herein schematically represented by VGAM1 FOLDED PRECURSOR through VGAM3 FOLDED PRECURSOR, each of which VGAM precursor RNAs being a hairpin shaped RNA segment, corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1.

[11451] The above mentioned VGAM precursor RNAs are `diced` by DICER COMPLEX of Fig. 1, yielding respective short RNA

segments of about 22 nucleotides in length, VGAM361 RNA and VGAM362 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, each of which VGAM RNAs corresponding to VGAM RNA of Fig. 1.

[11452] VGAM361 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM361 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM361 host target RNA into VGAM361 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11453] VGAM362 RNA, herein schematically represented by VGAM1 RNA through VGAM3 RNA, binds complementarily to a host target binding site located in an untranslated region of VGAM362 host target RNA, herein schematically represented by VGAM1 HOST TARGET RNA through VGAM3 HOST TARGET RNA, which host target binding site corresponds to a host target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig. 1, thereby inhibiting translation of VGAM362 host target RNA into VGAM362 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN, all of Fig. 1.

[11454] It is appreciated that a function of VGR440 gene, herein designated VGR GENE, is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGR440 gene include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGR440 gene correlate with, and may be deduced from, the identity of the host target genes, which are inhibited by VGAM RNAs comprised in the `operon-like` cluster of VGR440 gene: VGAM361 host target protein and VGAM362 host target protein, herein schematically represented by VGAM1 HOST TARGET PROTEIN through VGAM3 HOST TARGET PROTEIN. The function of these host target genes is elaborated hereinabove with reference to VGAM361 and VGAM362.

[11455] It is appreciated by persons skilled in the art that the present invention is not limited by what has been particularly shown and described hereinabove. Rather the scope

of the present invention includes both combinations and subcombinations of the various features described hereinabove as well as variations and modifications which would occur to persons skilled in the art upon reading the specifications and which are not in the prior art.
